AN INTRODUCTION TO THE STUDY OF MINORITY GROUPS IN THE UNITED STATES

Chapter 1  Diversity in the United States: Questions and Concepts
Chapter 2  Assimilation and Pluralism: From Immigrants to White Ethnics
Chapter 3  Prejudice and Discrimination

The United States is a nation of groups as well as individuals. These groups vary in many ways, including their size, wealth, education, race, ethnicity, culture, religion, and language. Some groups have been part of American society since colonial days, while others have formed recently. Questions of unity and diversity are among the most pressing issues facing the United States today. Who should be considered American? How should these groups relate to one another? Should we celebrate our diversity and preserve the many cultural heritages and languages that currently exist? Should we encourage everyone to adopt Anglo American culture and strive to become more similar? Is it possible to do both?

We begin to address these questions and other related issues in Chapters 1 and 2. Our goal throughout the text is to help you develop a broader, more informed understanding of the past and present forces that have created and sustained the groups that make up the United States. We’ll sustain this focus throughout this book.

Chapter 3 addresses prejudice and discrimination—feelings, attitudes, and actions that support and reinforce the dividing lines that separate us into groups. How and why do these negative feelings, attitudes, and actions develop? How are prejudice and discrimination related to inequality and competition between groups? How can we reduce or eliminate them?
LEARNING OBJECTIVES

By the end of this chapter, you will be able to do the following:

1.1 Explain the increasing racial and ethnic diversity of the United States.
1.2 Understand the concept of a minority group.
1.3 Explain the sociological perspectives that will guide this text, especially as they relate to the relationships between inequality and minority-group status.
1.4 Explain how race and gender contribute to minority-group status.
1.5 Comprehend four of the key concepts in dominant–minority relations: prejudice, discrimination, ideological racism, and institutional discrimination.
1.6 Apply a global perspective to the relationship between globalization and immigration to the United States.

Consider the following six Americans. Each is, of course, a unique person but they also represent millions of other members of our society.

- **Kim Park** is a 24-year-old immigrant from Korea living in New York City. He arrived three years ago and works in his uncle's grocery store. Instead of wages, Kim receives room and board and spending money. He eventually wants to become a U.S. citizen and manage the store when his uncle retires.
  
  Over the years, many different ethnic and racial groups have called Kim's neighborhood home. As recently as the 1950s, the area was almost exclusively Jewish. The Jewish residents have since died or moved and were replaced by Black, Hispanic, and Asian groups. Today, the neighborhood continues to change.

- **Juan Yancy** is one of Kim's regular customers. Despite Kim's halting English, the two men usually chat when Juan stops by on his way home from his janitorial job at a downtown hotel. Juan's mother is Puerto Rican, his father is Filipino but, when asked, he refers to himself as Puerto Rican.

- **Shirley Umphlett**, a Black woman, spent much of her childhood in the apartment building where Shirley Umphlett, a Black woman, spent much of her childhood. In the 1920s, Shirley's family moved from Alabama in search of work. Her father worked construction, but because most labor unions and employers were “white only,” he had no access to the better paying, more stable jobs and was often unemployed. Shirley's mother worked as a house cleaner to help meet family expenses. Shirley did well in school, attended college on scholarship, and is now a successful business executive. She is in her 40s, married, and has two children.

- **Mary Farrell**, a fourth-generation Irish Catholic. Mary's great-grandparents came to New York in the 1880s. Her great-grandfather found work on the docks, and her great-grandmother worked as a...
housekeeper. They had seven children and 23 grandchildren, and Mary has more than 50 cousins living within an hour of New York City. Each generation of Mary's family tended to do a little better educationally and occupationally. Mary's father was a firefighter, and her sister is a lawyer.

Several years ago, Mary's relations with her family were severely strained when she told them that she was a lesbian and would be moving in with her long-time partner, Sandra. Mary's parents, traditional Catholics, found it difficult to accept her sexual orientation, as did many of her other relatives. While she has been open with her family (much to their discomfort), she mostly stays “in the closet” at work, fearing the potential repercussions from parents and administrators. Still, she and Sandra are planning to marry soon.

• Mary is friends with Hector Gonzalez. Hector's parents came to the United States from Mexico. Every year, they crossed the border with other farm laborers and then returned at the end of the season. With help from a cousin, Hector's father eventually got a job as a cabdriver in New York City, where Hector was raised. Hector thinks of himself as American but is interested in his parents' home village back in Mexico, where most of his extended family still lives. Hector is bilingual and has visited the village several times. His grandmother still lives there, and he calls her once a month.

• Hector regularly eats lunch at a restaurant where most of the servers are Black, and the kitchen workers are Latino. One of the kitchen helpers, Ricardo Aldana, is in the country illegally. He left his home village in Guatemala five years ago. He lives with five others and sends 40% of his wages to his family in Guatemala. His most fervent wish is to go home, get married, and start a family.

• The restaurant is in a building owned by a corporation headed by William Buford III, a white American. William invests the bulk of his fortune in real estate and owns land and buildings throughout New York. The Bufords have a townhouse in Manhattan but prefer to spend most of their time at their rural Connecticut estate. William attended the finest private schools and, at age 57, he is semiretired, plays golf twice a week, and vacations in Europe. He was raised a Mormon but is not religious and has little interest in the history of his family.

These individuals belong to groups that vary along some of the most consequential dimensions within our society—ethnicity, race, language, immigration status, social class, sexual orientation, gender, and religion—and their lives have been shaped by these affiliations (some more than others, of course). Some of these statuses are privileged, while others are disadvantaged and can evoke rejection and contempt. Each person's statuses are mixed. For example, despite his elite status, William has occasionally felt the sting of rejection because of his Mormon background. Juan ranks low on race and class but enjoys some of the advantages of being a man, while Mary's chances for upward mobility in the school system are reduced by her gender and sexual orientation. Each of these individuals is privileged in some ways and limited in others—as are we all.

As reflected by these individuals, United States is growing more diverse in culture, race, religion, and language. The number of Americans who identify as multiracial or who can connect themselves to different cultural traditions is increasing. Where will this increasing diversity lead us? Will our nation fragment? Could we dissolve into warring enclaves—the fate of more than one modern nation? Or can we find connection and commonality? Could we develop tolerance, respect, or even admiration for one another? Can we overcome the legacies of inequality established in colonial days? Can Americans embrace our nation's increasing diversity and live out our motto, *E Pluribus Unum* (out of many, one)?

This book raises many questions about the past, present, and future of group relationships in America. For example, what social, political, and economic forces shaped those relationships historically and how are they shaping contemporary group relations? How do racial and ethnic groups relate to each other today? What kind of society are we becoming because of immigration? What does it mean to be an American? What kind of society do we want to become and how can we move in that direction?
These questions are complex, and the answers aren’t obvious or easy to come by. There is no guarantee that we, as a society, will be willing or able to resolve all the issues related to intergroup relations. However, the issues won’t disappear or resolve themselves if we ignore them. We’ll never make progress unless we address the issues honestly and with an accurate base of knowledge and understanding. We hope this book helps you develop thoughtful, informed positions on these issues.

Throughout our inquiry, we’ll rely on sociology and other social sciences for concepts, theories, and information to gain a greater understanding of the issues. The first two chapters introduce many of the ideas that will guide our investigation. Part 2 explores how relations between the dominant group and minority groups have evolved over time. Part 3 analyzes the current situation of U.S. racial and ethnic minority groups. Finally, Part 4 explores group divisions based on gender and sexual orientation, and patterns of group relationships around the globe. In Part 5, the final section of the book, we explore many of the challenges facing our society (and the world) and offer conclusions from our inquiry.

**DIVERSITY IN THE UNITED STATES: TRENDS AND QUESTIONS**

America is a nation of immigrants and groups. Today, about 13.7% of the U.S. population was born in some other nation. (U.S. Census Bureau, 2020a) The population of some states is more than one fourth foreign-born (e.g., California is 26% foreign-born), (U.S. Census Bureau, 2020a) and some cities are more than one-third foreign-born (e.g., New York is 37% foreign-born.), (U.S. Census Bureau, 2020b) Since the infancy of our society, Americans have been arguing, often passionately, about inclusion and exclusion and about unity and diversity. Every member of our society is, in some sense, an immigrant or the descendant of immigrants. Even Native Americans migrated to this continent, albeit thousands of years ago. We are all from somewhere else, with roots in other parts of the world. Some Americans came here in chains; others came on ocean liners, on planes, on busses, and even on foot. Some arrived last week, while others have had family here for centuries. Each wave of newcomers has altered our social landscape. As many have observed, our society is continually under construction and seems permanently unfinished.

Today, America is remaking itself yet again. Large numbers of immigrants are arriving from around the world, and their presence has raised questions about what it means to be an American, who should be granted U.S. citizenship, and how much diversity is best for society. How do immigrants affect America? Are they bringing new energy and revitalizing the economy? Are they draining resources such as school budgets, health care, and jobs? Both? How do they affect Black Americans, Asian Americans, Native Americans, and other groups? Are they changing what it means to be an American? If so, how?

In 2008, Americans elected Barack Obama to become our nation’s first African American president. To some, this victory suggested that the United States has finally become what people often claim it to be: a truly open, “color-blind” society where one succeeds based on merit. In 2016, Donald Trump became our country’s 45th president. Some see the rise of racist and xenophobic speech and actions that emerged during the 2016 and 2020 elections as a kind of backlash—not just against Democrats or the political system, but against the diversity initiatives that expanded under the Obama administration. In 2020, Americans elected Joe Biden as president but the start of his term was marked by an attack on the U.S. Capitol led by a coalition of racist, xenophobic, extremist groups that demonstrated some of the ugliest aspects of American history and culture.

Even as we debate the implications of immigration, other long-standing issues about belonging, fairness, and justice remain unresolved. Native Americans and Black Americans have been a part of this society since its start, but they’ve existed largely as outsiders—as slaves, servants, laborers, or even enemies—to the mainstream, dominant group. In many ways, they haven’t been treated as “true Americans” or full citizens, either by law or custom. The legacies of racism and exclusion continue to affect these groups today and, as you’ll see in future chapters, they and other American minority groups continue to suffer from inequality, discrimination, and marginalization.

Even a casual glance at our schools, courts, neighborhoods, churches, or corporate boardrooms—indeed, at any nook or cranny of our society—reveals pervasive patterns of inequality, injustice, and
unfairness and different opportunities. So, which is the “real” America: the land of acceptance and opportunity or the one of insularity and inequity?

Some of us feel intensely connected to people with similar backgrounds and identify closely with a specific heritage. Others embrace multiracial or multiethnic identities. Some people feel no particular connection with any group or homeland. Others are unsure where they fit in the social landscape. Still, elements of our identity influence our lives and perceptions. The groups to which we belong affect our understanding of many social and political issues. Group membership, including our race or ethnicity, gender, class, and sexual orientation, shape our experiences and, therefore, how we think about American society, the world, and ourselves. Additionally, group membership shapes the opportunities available to us and to others in our society.

How do we understand these contrasts and divisions? Should we celebrate our diversity or stress the need for similarity? How can we incorporate all groups while avoiding fragmentation and division? What can hold us together as a nation? The United States may be at a crossroads concerning these issues. Throughout this book, you’ll have an opportunity to reexamine the fundamental questions of citizenship and inclusion in our society. This chapter reviews the basic themes to help you do that effectively.

Because our group memberships shape our experiences and worldviews, they also affect the choices we make, including those in the voting booth. People in different groups may view decisions in different ways due to their divergent group histories, experiences, and current situations. Without some knowledge of the many ways someone can be an American, the debates over which direction our society should take are likely to be unmeaningful or even misunderstood.

### Increasing Diversity

The choices about our society’s future may feel especially urgent because the diversity of American society is increasing dramatically, largely due to high rates of immigration. Since the 1960s, the number of immigrants arriving in America each year has more than tripled and includes groups from around the world.

People’s concerns about increasing diversity are compounded by other unresolved issues and grievances. For example, in Part 3, we document continuing gaps in income, poverty rates, and other measures of affluence and equality between minority and dominant groups. In many ways, the problems currently facing Black Americans, Native Americans, Hispanic Americans, Asian Americans, and other minority groups are as formidable as they were a generation (or more) ago. Given these realities, how can the United States better implement its promise of equality for all?

Let’s consider the changing makeup of the United States. Figure 1.1 presents the percentage of the total U.S. population in each of the five largest racial and ethnic groups. First, we’ll consider this information at face value and analyze some of its implications. Then, we’ll consider (and question) the framing of this information, such as group names and why they matter.

Figure 1.1 shows the groups’ actual relative sizes from 1980 through 2020 and projected relative sizes of each group through 2060. The declining percentage of non-Hispanic whites reflect the increasing diversity in the United States. As recently as 1980, more than 8 out of 10 Americans were non-Hispanic whites, but by the middle of this century, non-Hispanic white people will become a numerical minority. Several states (Texas, California, Hawaii, and New Mexico) already have “majority minority” populations and non-Hispanic whites are only 49.9% of all children less than 15 (Frey, 2019).

Researchers predict that Black American and Native American populations will increase in absolute numbers but will remain similar in relative size. However, Hispanic American, Asian American, and Pacific Islander populations will grow dramatically. Asian American and Pacific Islander groups together constituted only 2% of the population in 1980, but that will grow to 10% by midcentury. The most dramatic growth, however, will be among Hispanic Americans. In 2002, this group surpassed Black Americans as the largest minority group. Researchers expect it will be almost 30% of the U.S. population by 2060.

Projections about the future are educated guesses based on documented trends, but they suggest significant change. Our society will grow more diverse racially and culturally, becoming less white
and less European—and more like the world as a whole. Some people see these changes as threats to
traditional white, middle-class American values and lifestyles. Other people view these demographic
changes as part of the ebb and flow of social life. That is, society has changed ever since it began; this is
merely another phase in the great American experiment. Which viewpoints are most in line with your
own and why?

What’s in a Name?

The group names we used in Figure 1.1 are arbitrary, and no group has clear or definite boundaries. We
use these terms because they are familiar and consistent with the labels used in census reports, much of
the sociological research literature, and other sources of information. Although such group names are
convenient, this doesn’t mean that they are “real” in any absolute sense or equally useful in all circum-
stances. These group names have some serious shortcomings. For example, they reflect social conven-
tions whose meanings change over time and location. To underscore the social construction of racial
and ethnic groups, we use group names interchangeably (e.g., Blacks and African Americans; Hispanic
Americans and Latino). Nevertheless, issues remain.

First, the race/ethnic labels suggest groups are homogeneous. While it’s true that people within
one group may share some general, superficial physical or cultural traits (e.g., language), they also vary
by social class, religion, gender, sexual orientation, and in many other ways. People within the Asian
American and Pacific Islander group, for example, represent scores of different national backgrounds
(Japanese, Pakistanis, Samoans, Vietnamese), and the categories of Native American or Alaska Native
include people from hundreds of different tribal groups. If we consider people’s other social statuses
such as age and religious affiliation, that diversity becomes even more pronounced. Any two people
within one group (e.g., Hispanics) might be quite different from each other in some respects and like
people from “different” racial/ethnic groups (e.g., white people).

Second, people don’t necessarily use these labels when they think about their own identity. In this
sense, the labels aren’t “real” or important for all the people in these racial/ethnic groups. For example,
many white people in the United States think of themselves as “just American.” Many Hispanic Americans think of themselves in relation to ethnic origin, such as Mexican or Cuban (see Chapter 7). Or they may identify with a particular region or village in their homeland. For LGBTQIA group members, sexual orientation may be more important to their identity than their race or ethnicity. Thus, the labels don’t always reflect the ways people think about themselves, their families, or where they come from. The categories are statistical classifications created by researchers and census takers to help them organize information and clarify their analyses.

Third, even though the categories in Figure 1.1 are broad, several groups don’t neatly fit into them. For example, where should we place Arab Americans and recent immigrants from Africa? These groups are relatively small (about one million people each), but there is no clear place for them in the current categories. Should we consider Arab Americans as “Asian,” as some argue? Should recent immigrants from Africa be in the same category as African Americans? Should we create a new group for people of Middle Eastern or North African descent (MENA)? The point is that any such classification schemes will have ambiguous boundaries.

Further, we can’t neatly categorize people who identify with more than one racial or ethnic group. The number of “mixed-group” Americans is relatively small today—about 3.5% of the total population (U.S. Bureau of the Census, 2020). However, between 2000 and 2019, the number of people who chose more than one racial or ethnic category on the U.S. census increased by 46% (from 2.4% to 3.5% of the total population) (Jones & Bullock, 2012; U.S. Census Bureau, 2020a). This trend is likely to continue to increase rapidly because of the growth in interracial marriage.

To illustrate, Figure 1.2 shows dramatic increases in the percentage of “new” marriages (couples that got married in the year prior to the survey date) and all marriages that unite members of different racial or ethnic groups (Livingston & Brown, 2017). Obviously, the greater the number of mixed racial or ethnic marriages, the greater the number of mixed Americans who will be born of such partnerships. One study estimates that the percentage of Americans who identify with two or more races will more than double between 2014 (when it was 2.5%) and 2060 (when it will be 6.2%; Colby & Ortman, 2015, p. 9).

Finally, we should note that group names are social constructions, or ideas and perceptions that people create in specific historical circumstances and that reflect particular power relationships. For example, the group “Native Americans” didn’t exist before the European exploration and colonization of North America. Before then, hundreds of separate societies, each with its own language and culture, lived across North America. Native Americans thought of themselves primarily in terms of their own
tribal group, not in terms of the totality of groups spread across the vast expanse of the North American continent. However, European conquerors constructed them as one group: the enemy. Today, many Americans see Native Americans as one group. This reflects their historical defeat and domination by white European colonists, which led to Native Americans’ current status as a minority group in a largely white society.

Likewise (although through different processes), African, Hispanic, and Asian Americans came to be seen as separate groups as the result of their unequal interactions with white Americans. These group labels have become real because people believe they are real. We use these familiar group labels to help our discussion of complex topics, but they don’t reflect some unchangeable truth or reality regarding racial or ethnic groups.

QUESTIONS FOR REFLECTION

1. In the chapter opening, William—the wealthy, white real-estate mogul—has the most privileged statuses compared with the others [e.g., Kim Park, Juan Yancy, Shirley Umphlett]. How would you rank the others status? Consider class, gender, sexual orientation, race and ethnicity, etc. Which statuses carry the most weight in our society? Why?

2. Savannah is a white, 27-year-old woman who was raised in Georgia but now lives in South Dakota. She is an Episcopalian, has a degree in computer science, and makes $60,000 a year. She is married to Tom, her college sweetheart. Winona is a 60-year-old woman and a member of the Lakota nation. She was raised in South Dakota but moved to California to pursue her career as a pharmacist. She is married to Robert and they have one child. Although the census would classify Savannah and Winona as belonging to different racial/ethnic groups, they are similar in many ways. In what ways are their similarities more significant than their differences?

3. If asked about your group membership, which of the groups in Figure 1.1 would you choose, if any? Do you feel that you belong to one group or several? How much does your group membership shape your circle of friends, your experiences, and your worldview? How important is your group membership to your self-identity?

4. Over the past 5 to 10 years, what signs of increasing diversity have you seen in your community? What benefits and challenges have come with increasing diversity?

5. What does it mean to be American? If you asked Americans today, a popular answer might be freedom. What does that mean to you—freedom to do what? Or freedom from what? How do you think people of other countries or generations might respond?

NARRATIVE PORTRAIT: ON BEING AMERICAN

Carla, now in her 20s, is the adopted daughter of an affluent white family. She grew up in the suburbs and enjoyed a comfortable middle-class lifestyle. She has never met her birth parents but knows that her biological mother was Korean American, and just 16 years old at the time of her birth. She knows nothing about her birth father. Carla is beginning to reconcile herself to how most Americans perceive her.

For much of her life, Carla has felt caught between her biological heritage and that of her adopted family. She often hesitates when people ask about her family or where she is from. Is she Asian American, in the terms of the U.S. Census (Figure 1.1)? Or, should she identify herself to people [or when she fills out employment applications] as “non-Hispanic white” because the only lifestyle she has ever known is white, suburban, middle class? For her, the social construction of race is very real and, at the same time, false. Here is part of what she has to say about her identity:

When I was growing up, my parents would try to teach me about my Korean heritage. We would read books about Korean history and culture, my mom learned to prepare some Korean dishes, and we even discussed taking a trip to Korea—but never did. Looking back, I really appreciate what they were trying to do, but it all felt foreign to me, you know? Like we were discussing Bolivia or Kenya...

But then, someone would make assumptions about me based on my looks. They would think that I was good at math or nerdy or couldn’t speak English. I can’t tell you how many times someone has
asked me, "Where are you from?" When I said, "I’m from here," most people wouldn’t believe me and would ask, "No, where are you really from?"

Sometimes I tried to "be Korean" and even attended some meetings of the Asian Student Association when I was in school, but it felt wrong—it just wasn’t me. But then, something would happen. . . . Like one time I was just walking through the mall, and some old white guy came up and said, out of the clear blue sky, "You people are ruining this country!" I mean, who did he think I was?

So, yeah, it took a long time to make peace with who I am and how others perceive me. But, now I think that I’m just me, you know? People can look at me one way and put me in all those different categories, but that’s their problem. It’s not who I am. It’s not me!

Source: Personal communication to the authors. Carla’s name and exact circumstances have been fictionalized to preserve her privacy.

Questions to Consider
1. Is Carla’s confusion about her identity a result of her social and physical characteristics? Or, does it result from how other people see her? Explain.
2. How might Carla’s situation change if she were a man? What if her birth mother were Hispanic or black?

WHAT IS A MINORITY GROUP?

A common vocabulary will help us understand and discuss the issues raised in this text with greater clarity. The mathematical connotation of the term minority group implies that minority groups are small. However, they can be quite large—even a numerical majority. For example, most sociologists consider women a minority group, although they are a numerical majority of the U.S. population. White people are a numerical minority in South Africa, accounting for less than 8% of the population (Central Intelligence Agency, 2020). However, they’ve been the most powerful and affluent group in that nation’s history for centuries. Despite the end of apartheid (state-sanctioned racial inequality) in South Africa, white people keep their advantage in many ways (e.g., economically, politically). Therefore, sociologists would consider them the dominant group. Sociologists define minority status in terms of the distribution of resources and power. We use the definition of minority group developed by Wagley and Harris (1958) that emphasizes these characteristics:

1. Minority group members experience a pattern of disadvantage or inequality.
2. Minority group members share a visible trait or characteristic that differentiates them from other groups.
3. Minority group members are aware of their shared status with other group members.
4. Group membership is usually determined at birth.
5. Members tend to form intimate relationships (close friendships, dating partnerships, and marriages) within the group.

Next, we briefly explain these five characteristics. Because inequality and visibility are the most important characteristics of minority groups, we’ll examine them in detail later in the chapter.

1. Inequality. The first and most important defining characteristic of a minority group is its inequality (some pattern of disadvantage). The degree of disadvantage varies over time and location and includes such slight irritants as a lack of desks for left-handed students or a policy of racial or religious exclusion at an expensive country club. (Note, however, that you might not agree that the irritant is slight if you’re a left-handed student awkwardly taking notes at a right-handed desk or if you’re a golf aficionado who happens to be Black or Jewish.) The most significant inequalities include exploitation, such as slavery and genocide (the intentional
killing of a group, such as the mass execution of Jewish, Slavic, Roma, gays and lesbians, and other people under Nazi rule in Germany).

Whatever its scope or severity, whether it affects people’s ability to gain jobs, housing, wealth, political power, police protection, health care, or other valued resources, the pattern of disadvantage is the key characteristic of a minority group. Because the group has less of what society values, some people refer to minority groups as *subordinate groups*.

The pattern of disadvantage members of the minority group experience results from the actions of another group that benefits from and tries to sustain the inequality. This advantaged group is the *dominant group*. We use the latter term most frequently because it reflects the patterns of inequality and the lack of power experienced by minority groups. Keep in mind that the inequalities we see today were established in the past, sometimes centuries ago or more. Privilege exists even when the beneficiaries are unaware of it.

2. **Visibility.** The second defining characteristic of a minority group is some *visible trait* or characteristic that sets members apart and that the dominant group holds in low esteem. The trait can be cultural (language, religion, speech patterns, or dress styles), physical (skin color, stature, or facial features), or both. Groups defined primarily by their cultural characteristics such as Irish Americans and Jewish Americans are *ethnic minority groups*. Groups defined primarily by their physical characteristics, such as Black Americans and Native Americans, are *racial minority groups*. These categories overlap. So-called ethnic groups may also have what some people see as distinguishing physical characteristics (e.g., the stereotypical Irish red hair or “Jewish nose”). Racial groups may also have (or be thought to have) cultural traits that differ from the dominant group (e.g., differences in dialect, religious values, or cuisine).

These distinguishing traits help identify minority group members and facilitate separating people into different groups. Thus, such traits help to maintain the patterns of disadvantage. That is, the dominant group has (or at one time had) enough power to create the distinction between groups and thus solidify a higher position for itself. These markers of group membership are crucial. Without visible signs, it would be difficult or impossible to identify who was in which group, and the system of minority group oppression would collapse.

The characteristics marking the boundaries between groups usually aren’t significant in and of themselves. They are selected for their visibility and convenience and, objectively, may be trivial and unimportant. For example, scientists now conclude that skin color and other so-called racial traits have little scientific, evolutionary, medical, or biological importance (Gannon, 2016; Yudell et al., 2016). For example, darker skin color simply reflects the body’s response to sunlight. In areas with greater sunlight (closer to the equator), people’s bodies produce melanin, which screens out the sun’s ultraviolet rays and protects the skin. Skin color emerged as an important marker of group membership in our society through a complex and lengthy historical process, not because it has any inherent significance. Again, these markers of minority group membership become important because people give them significance (e.g., superiority, inferiority).

3. **Awareness.** A third characteristic of minority groups is that the members are aware of their differentiation from the dominant group and their shared disadvantage. This shared social status can provide a sense of solidarity and serve as the basis for strong intragroup bonds. As noted earlier, minority and dominant groups can experience life differently. Thus, minority group members may have worldviews that are markedly different from those of the dominant group and from other minority groups. For example, public opinion polls often show sizeable group differences about the seriousness and extent of discrimination in America. Figure 1.3 shows persistent and sizeable gaps in the percentage of nationally representative samples of white and Black people who agree that Black and white people have equal job opportunities. Given their different group histories, experiences, and locations in the social hierarchy, it may not surprise you that Black Americans see more racial inequality than white people. Even after
President Obama’s election in 2008, the percentage of Black Americans who believed equal opportunity exists was about half the rate of white Americans.

Both groups have become more pessimistic about equal opportunity in recent years. A 2020 national poll showed that only 64% of Americans believed Black children have the same opportunity as white children to get a good education. This is the lowest percentage on record since Gallup began asking that question in 1962, less than a decade after the Supreme Court voted to desegregate public schools in Brown v. the Board of Education (1954). Only 67% believe Black Americans have equal opportunities to get housing, which is the lowest rating on this question since 1989 (Brenan, 2020).

4. **Ascription.** A fourth characteristic of minority groups is that, generally, membership is an ascribed status given to them, often at birth. The traits that identify minority group membership are typically hard to change. Thus, minority group status is usually involuntary and for life.

In some cases—with “racial” minority groups, for example—this defining characteristic may seem obvious and hardly worth mentioning. Remember, however, that group labels are social constructions, based on particular historical circumstances and shared cultural perceptions. Thus, group membership can be negotiable and changeable, and a person’s status at birth is not necessarily constant throughout his or her lifetime. A member of a racial minority may be able to “pass” as a member of a different group, and a member of a religious minority may be able to change status by changing his or her faith.

It’s important to keep in mind the qualification that minority status is generally a matter of birth. There are important exceptions to the general rule and a great deal more ambiguity regarding group membership than may appear at first glance. Also, for some groups—gays and lesbian Americans in particular—the notion of membership by ascription is debated. Some say homosexuality is inborn while others say it is learned. We’ll address this issue in Chapter 12.

5. **Intimate Relationships.** Finally, minority group members tend to form emotionally close bonds with people like themselves. That is, members tend to choose each other as close friends, dating partners, and legal spouses or cohabitational partners. (Members of the dominant group do this, too.)

Pervasive racial and ethnic segregation of neighborhoods, schools, and other areas of American society influence who one meets or spends time with on a regular basis. In some cases, the dominant group dictates this pattern. For example, many states outlawed interracial marriages until the U.S. Supreme Court declared laws against miscegenation unconstitutional in the 1967 case, Loving v. Virginia (Bell, 1992).
The Wagley and Harris (1958) multipart definition of a minority group encompasses “traditional” minority groups such as Black Americans and Native Americans but we can apply it to other groups. For instance, women as a group fit the first four criteria, and we can analyze their experience with many of the same concepts and ideas that guide our analysis of racial and ethnic minority groups. Similarly, we can apply this concept to Americans who are gay, lesbian, bisexual, or transgender; to Americans with disabilities; to Americans who are left-handed; and to Americans who are very old, very short, very tall, or overweight. We’ll consider some of these groups in future chapters. For now, just note that you can apply ideas from this book more broadly than you might think at first. And, we hope that you’ll be able to use these insights in your life after your course ends.

QUESTIONS FOR REFLECTION

6. Consider the definition of a minority group. Which parts apply to gay and lesbian Americans? Which parts, if any, apply to other groups of interest that are not defined as American minority groups, such as Christians or men? What do your answers suggest about differences between minority and majority groups?

PATTERNS OF INEQUALITY

The most important defining characteristic of minority group status is inequality. As you’ll see, minority group membership affects access to jobs, education, wealth, health care, and housing. It is associated with a lower (often much lower) proportional share of goods and services and more limited opportunities for upward mobility.

Stratification is the hierarchical ranking of groups that results in the unequal distribution of goods and services in society. Every human society, except perhaps the simplest hunter–gatherer societies, is stratified to some degree. You can visualize these divisions as horizontal layers (or strata) that differ from one another by the amount of resources they command. Economic stratification results in different social classes; Figure 1.4 shows one view of the class system. Many criteria (e.g., education, age, gender, power, parent’s social class) may affect a person’s social class position and their access to goods and services. Minority group membership is one of these criteria, and it has a powerful impact on the distribution of resources in the United States and in other societies.

The next section considers different theories about the nature and dimensions of stratification. Then, we discuss how minority group status relates to stratification.

Theoretical Perspectives

Sociologists (and other social scientists) have been concerned with stratification and inequality since the formation of sociology in the 19th century. We highlight four of the most significant thinkers in this section. An early and important contributor to our understanding of the significance of social inequality was Karl Marx, the noted social philosopher and revolutionary. Half a century later, sociologist Max Weber (pronounced Mahks Vay-ber), a central figure in the development of sociology, critiqued and elaborated on Marx’s view of inequality. Gerhard Lenski was a modern sociologist whose ideas about the influence of economic and technological development on social stratification are relevant for comparing societies and understanding the evolution of intergroup relations. Finally, we consider another modern sociologist, Patricia Hill Collins, who argues for an intersectional approach to inequality, which views inequalities based on class, race or ethnicity, gender (and other social statuses) as a single, interlocking system of inequality.

Karl Marx

Although best known as the father of modern communism, Karl Marx was also the primary architect of a political, economic, and social philosophy that has played a significant role in world affairs for...
Marxism is a complex theory of history and social change in which inequality is a central concern. Marx argued that the most important source of inequality in society was the system of economic production. He focused on the **means of production**, or the materials, tools, resources, and social relationships by which a society produces and distributes goods and services. In an agricultural society, the means of production include land, draft animals, and plows. In an industrial society, the means of production include factories, commercial enterprises, banks, and transportation systems, such as railroads.

In Marx’s view, all societies include social classes that struggle over the means of production. In industrial societies, the rise of capitalism created a new class system with two main classes. The **bourgeoisie**, or capitalist class, owns or controls the means of production. It benefits from that arrangement and exploits and oppresses the **proletariat** or working class. Marx called them “two great hostile camps” (Marx & Engels, 1967, p. 1). He believed that class conflict was inevitable and that, ultimately, the working class would revolt against the bourgeoisie and create a society without exploitation, coercion, or inequality. That is, it would create a classless society.

Marx is consistently named one of the most influential thinkers of all time; yet, scholars and others have extensively critiqued or modified his ideas. Nevertheless, modern social science owes a great deal to his insights about inequality, class struggle, social conflict, and group relations, as you’ll see in upcoming chapters.

Max Weber

One of Marx’s major critics was Max Weber, a German sociologist who did most of his work around the turn of the 20th century. Weber saw Marx’s view of inequality as too narrow. Weber argued that inequality included dimensions other than one’s relationship to the means of production. Weber expanded on Marx’s view of inequality by identifying three separate components of stratification.

First, economic inequality is based on ownership or control of wealth (such as property) and income (money from employment, interest on bank holdings, or other payments). This is like Marx’s concept of class, and Weber used the term class for this specific form of inequality.

A second dimension of stratification involves differences in prestige, or the amount of honor, esteem, or respect that people give us. Different factors influence prestige, including one’s class position, family lineage, athletic ability, and physical appearance. Group membership also affects prestige. People typically give less prestige to minority group members than dominant group members.

The third component of stratification is power, or the ability to influence others, impact the decision-making process of society, and pursue and protect one’s self-interest and achieve one’s goals. One source of power is a person’s standing in politically active organizations that lobby state and federal legislatures, such as labor unions or interest groups. Some politically active groups have access to great wealth and can use it to promote their causes. Other groups may rely more on their size and ability to mobilize large demonstrations to achieve their goals. Political organizations and the people they represent vary in the power that they can mobilize to control political decision making.

Typically, these three dimensions of stratification go together: wealthy, prestigious classes are generally more powerful (more likely to achieve their goals or protect their self-interest) than low-income groups or groups with little prestige. However, power is a separate dimension: even very impoverished groups have sometimes found ways to express their concerns and pursue their goals.

Weber’s concept of stratification offers more complexity than Marx’s. For example, instead of simply being bourgeoisie or proletariat, Weber suggests that people can be elite in some ways but not in others. An aristocratic family that has fallen on hard financial times might belong to the elite in terms of family lineage and prestige but not in terms of wealth. Or a major figure in the illegal drug trade could enjoy substantial wealth but be held in low esteem.

Gerhard Lenski

Gerhard Lenski was a modern sociologist who expanded on Weber’s ideas by analyzing stratification in the context of societal evolution, or the level of development of a society (Nolan & Lenski, 2004). Lenski argues that the degree of inequality or the criteria affecting a group’s position is closely related to subsistence technology, or how the society meets people’s basic needs for food, water, shelter, and so on. For example, preindustrial agricultural societies rely on human and animal labor to generate the food necessary to sustain life. Inequality in these types of societies centers on control of land and labor because they are the most important means of production for that level of development.

In modern industrial societies, land ownership isn’t as crucial as control of financial, manufacturing, and commercial enterprises. Because the control of capital is more important than control of land for those societies, the level of development and the nature of inequality, differs.

The U. S. and other more-industrialized societies have entered another stage of development, so they are often referred to as postindustrial societies. In postindustrial societies, developments in new technology, computer-related fields, information processing, and scientific research create economic growth. Additionally, one’s economic success is closely related to formal education, specialized knowledge, and familiarity with new technologies (Chirot, 1994, p. 88; see also Bell, 1973).

These changes in subsistence technology, from agriculture to industrialization to an information-based society, alter the stratification system. As the sources of wealth, success, and power change, so
do the relationships between minority and dominant groups. For example, the shift to an information-based, high-tech, postindustrial society means that the advantages conferred by higher levels of education are magnified. Groups that have less access to schooling will likely rank low on all dimensions of stratification.

**Patricia Hill Collins**

Sociologist Patricia Hill Collins (2000) calls for an approach to the study of inequality and group relations that recognizes the multiplicity of systems of inequality and privilege in society. Some stratification systems are based on social class, while others categorize and rank people by their gender, race, ethnicity, sexuality, age, disability, and other criteria. Most people have complex social statuses, some more privileged and some less privileged. For example, consider a hetero-sexual, college-educated man with a professional job. These social statuses rank high in the United States. But what if he is Latino or bisexual? These latter statuses put him at a disadvantage in a society where whiteness and heterosexuality are more valued.

Collins stresses intersectionality, a view that acknowledges that everyone has multiple group memberships and that these crisscross or intersect to create different experiences for people with varying combinations of statuses. For example, the realities faced by gay, white-collar, Mexican American men are different from those faced by hetero-sexual, blue-collar Puerto Rican women, although both would be counted as Hispanic in Figure 1.1. From this perspective, you can see that no singular, uniform Hispanic American (or African American or Asian American) experience exists. Thus, we need to recognize how gender, class, sexual orientation, and other factors intersect with and reinforce one another.

Collins and other intersectional theorists critique the tendency to see inequality in terms of separate simple dichotomous systems, such as those based on class (blue collar vs. white collar), race (Black vs. white), or gender (men vs. women). An intersectional approach involves seeing how these statuses link together to form a “matrix of domination.” For example, white Americans aren’t a homogenous dominant group. Some group members, such as women or poor white people, are privileged in terms of their race (white) but subordinate in terms of their gender (women) or class (poor). Collins’s ideas help us see that who is the oppressed and who is the oppressor changes across social contexts, and people can occupy privileged and subordinated statuses simultaneously.

The separate systems of domination and subordination overlap and reinforce one another. This matrix of domination shapes people’s opportunities, experiences, and perceptions. As you’ll see in later chapters, race and gender interact with each other and create especially disadvantaged positions for people who rank lower on both dimensions simultaneously (e.g., see Figure 5.5, which shows that Black women consistently earn less income than either Black men of the same race and white women of the same gender).

Likewise, stereotypes and other elements of prejudice are gendered. For example, some stereotypical traits might be applied to all Black Americans (such as laziness), but others are applied only to women (e.g., “uppity”) or men (e.g., “thug”).

An intersectional approach stresses the multiplicity of systems of inequality and analyzes the connections between them. It sees groups as complex, not uniform. In this book, we’ll use an intersectional lens to explore how class and gender influence racial and ethnic minority group experiences. However, you can apply an intersectional approach to other dimensions of power and inequality, including disability, sexual orientation, and religion.
Chapter 1 • Diversity in the United States

Minority Group Status and Stratification

The theoretical perspectives we’ve just reviewed raise three important points about the connections between minority group status and stratification. First, minority group status affects access to wealth and income, prestige, and power. In the United States, minority group status has been and continues to be one of the most important and powerful determinants of one’s life chances, or opportunities and access to resources such as nutritious food, health care, education, and a job that provides a good income. We explore these complex patterns of inequality in Part 3, but observation of American society reveals that minority groups control proportionately fewer resources and that minority group status and stratification are complexly intertwined. Consider, for example, the life chances of two 18-year-olds. One is white, comes from a wealthy family, was educated in excellent private schools, traveled the world on holiday, and has had the opportunity to network with members of the American elite. The other is a recent immigrant who fled the war in Syria. This one is smart, hardworking, and proficient in English but has a low overall level of education, which makes it hard to find work that pays a living wage. Which person has had and will have greater life chances?

Second, although social class and minority group status are correlated, they are different dimensions of inequality and they vary independently. The degree to which one status affects the other varies by group and across time. Some groups, such as Irish or Italian Americans, have experienced considerable upward social mobility (or movement) within the class stratification system although they faced considerable discrimination in the past. Furthermore, as stressed by the intersectional approach, minority groups are internally divided by systems of inequality based on class, status, or power. Some members of a minority group can be successful economically, wield great political power, or enjoy high prestige while the majority of group members experience poverty and powerlessness. Likewise, members of the same social class vary by ethnicity, race, gender, sexual orientation, religion, age, and other social statuses.

Third, the struggle to control valued goods and services creates dominant–minority group relationships. Minority group structures (such as slavery) emerge so that the dominant group can control commodities such as land or labor, maintain its position at the top of the stratification system, or eliminate perceived threats to its well-being. Struggles over property, wealth, prestige, and power lie at the heart of every dominant–minority relationship. Marx believed that the ruling class shaped all aspects of society to sustain the economic system that underlies its privileged position. The treatment of minority groups throughout American history provides a good deal of evidence to support Marx’s point, as you’ll see in upcoming chapters.

QUESTIONS FOR REFLECTION

7. Consider the people described in the chapter opening (e.g., Kim Park, Juan Yancy). How does an intersectional approach help us understand their lives?

8. Consider the people described in the chapter opening. How do Weber’s ideas about prestige and power contribute to our understanding of their social class?

VISIBLE DISTINGUISHING TRAITS: RACE AND GENDER

In this section, we focus on the second defining characteristic of minority groups: the visible traits that represent membership. The boundaries between dominant and minority groups have been established along a wide variety of lines, including religion, language, skin color, and sexuality. Let’s consider two of the more visible markers of group membership—race and gender.

Race

Historically, race has been widely misunderstood, but the false ideas and exaggerated importance people have attached to race haven’t merely been errors of logic that are subject to debate. At various times
and places, ideas about race have resulted in some of the greatest tragedies in human history: immense exploitation and mistreatment, such as slavery and genocide. Myths about race continue today, though in different forms. To decrease the likelihood of further tragedies, it’s important to cultivate accurate understandings about race.

Thanks to advances in genetics, biology, and physical anthropology, we know more about what race is and, more importantly, what race isn’t. We can’t address everything in these first few pages, but we can establish a basic framework and use the latest scientific research to dispel some of the myths.

**Race and Human Evolution**

Humans first appeared in East Africa more than 160,000 years ago. Our ancient ancestors were hunters and gatherers who slowly wandered away from their ancestral region in search of food and other resources. Over the millennia, our ancestors traveled across the entire globe, first to what is now the Middle East and then to Asia, Europe, Australia, and North and South America (see Figure 1.5) (Gugliotta, 2008; Hirst, 2017).

“Racial” differences evolved during this period of dispersion, as our ancestors adapted to different environments and ecological conditions. For example, consider skin color, the most visible “racial” characteristic. As noted earlier, skin color derives from a pigment called melanin. In areas with intense sunlight, at or near the equator, melanin screens out the sun’s ultraviolet rays, helping to prevent sunburn and, more significantly, skin cancer. Thus, people from equatorial locations produce higher levels of melanin and have darker skin than people who live farther away from the equator (Jablonski & Chaplin, 2010). This almost certainly means that the first humans were dark skinned and that lighter skin colors are the more recent adaptation reflecting migration away from the equator (see Figure 1.6).

The lower concentration of melanin in people adapted to areas with less intense sunlight may also be a biological adaptation to a particular ecology. Lighter skin maximizes vitamin D synthesis, which is important for the absorption of calcium and protection against health problems such as rickets. That is, the skin color of any group reflects the melanin in their skin that helps them balance the need for vitamin D against the need to protect their skin from ultraviolet rays (Jablonski & Chaplin, 2010).

The period of dispersion and differentiation, depicted in Figure 1.5, began to end about 10,000 years ago, when some of our hunting and gathering ancestors developed a new subsistence technology and established permanent agricultural villages. Over the centuries, some settlements grew into larger societies, kingdoms, and empires that conquered and absorbed neighboring societies, some of which differed culturally, linguistically, and racially from each other. The great agricultural empires of the past—Roman, Egyptian, Chinese, Aztec—united different peoples, reversed the process of dispersion and differentiation, and began a phase of consolidation and merging of human cultures and genes.
Over the next 10,000 years following the first settlements, human genes were intermixed and spread around the world, eliminating any “pure” races (if such ever existed).

The differentiation created during the period of global dispersion was swamped by consolidation, a process that was greatly accelerated starting about 500 years ago when European nations began to explore and colonize much of the rest of the world (e.g., India, Africa). This consolidation of groups continues today. For example, we can see it with the increasing numbers of Americans who identify as multiracial. We see similar patterns across the world and throughout recent history.

**Race and Western Traditions**

Europeans had been long aware of racial variation but, aided by breakthroughs in ship design and navigation, the nations of Western Europe began regularly traveling to Africa, Asia, and eventually North and South America in the 1400s. The contact with the peoples of other continents resulted in greater awareness and curiosity about observable physical differences such as skin color.

European travel required tremendous time and resources. The goal wasn’t exploration for the sake of exploration, but to lay claim to valued resources (such as gold) that existed elsewhere. In the process, European nations such as England, France, Spain, and Russia conquered, colonized, and sometimes destroyed the peoples and cultures they encountered. This political and military domination (e.g., English colonization of India, French colonization of West and North Africa) required an ideology (belief system) to support it. From the beginning, Europeans linked physical variation with judgments about the relative merits of other races: People from conquering nations thought they were racially and culturally superior to the nations and peoples they conquered.

Since then, other countries have justified military conquest, genocide, exploitation, and slavery with similar racist and xenophobic thinking. But, the toxic form of racism that bloomed during the expansion of European power continues to haunt the world today. It was the basis for the concept of race that took root in the United States.

**Race and Biology**

Europeans primarily used race to denigrate, reject, and exclude people they perceived as nonwhite. However, as the tools of modern science developed, some people tried to apply the principles of scientific research to the concept of race. These investigations focused on constructing typologies or taxonomies to classify every person of every race into a category. Some typologies were quite elaborate, with numerous races and subraces. For example, the “Caucasian” race was often subdivided into Nordics.
(blond, fair-skinned Northern Europeans), Mediterraneans (dark-haired Southern Europeans), and Alpines (people between those categories, with qualities from both).

One major limitation of these classification systems is that the dividing lines between the so-called racial groups are arbitrary. There is no clear, definite point where, for example, “Black” skin color stops and “white” skin color begins. The characteristics used to define race blend imperceptibly into one another. Additionally, one racial trait (skin color) can appear with others (e.g., hair texture) in an infinite variety of ways. A given individual might have a skin color that people associate with one race, the hair texture of a second, the nasal shape of a third, and so forth.

Although people vary in their physical appearance, these differences don’t sort themselves out in ways that enable us to divide people into precise groups like species of animals. The differences between the so-called human races aren’t at all like the differences between elephants and butterflies. The ambiguous and continuous nature of “racial” characteristics makes it impossible to establish categories that have clear, nonarbitrary boundaries. Even the most elaborate racial typologies can’t address the fact that many individuals fit into more than one category while others don’t fit into any of them. So, who gets to decide how many groups exist and what racial group people belong to? We’ll address that question in future chapters.

Over the past several decades, advances in genetic research have provided new insights into race that negate the validity of such racial typologies and the racial myths associated with them. One

---

**FIGURE 1.7A** Changes in Racial and Ethnic Categories, 1790–1930

Source: U.S. Census data
A significant finding is that genetic variation within the traditional racial groups is greater than the variation between those groups (American Sociological Association, 2003; Gannon, 2016). That is, any two randomly selected members of the “Black” race will probably vary genetically from each other at least as much as they do from a randomly selected member of the “white” race. (See Figures 1.7a and 1.7b.) This finding refutes traditional, nonscientific ideas that racial categories accurately reflect groups of homogeneous people. In other words, the traditional American perception of race as based primarily on skin color has no scientific validity.

The Social Construction of Race

Sociologist W. E. B. Du Bois (who you’ll read about in Chapter 5) wrote that the “problem of the twentieth century is the problem of the color line” ([1903] 1997, page 45 c.f. Lee & Bean, 2007). He argues that our nation’s history of slavery and the resulting discrimination and inequalities were critical to how U.S. race relations have evolved and, by extension, to how they affect society today.

You can begin to understand the social construction of this “color line” when you examine the U.S. Census race/ethnicity categories over time. The U.S. Constitution (Section 2, Article 1) requires a census (or population count) every decade (Blank et al., 2004, p. 206). A state’s population influences its political representation in the U.S. House of Representatives, its taxation, and the federal resources it receives (Anderson & Fienberg, 1999).
The census also gathers important demographic data about household members such as their race, age, gender, occupation, level or education, marital status, and if they own their residence. The first census, in 1790, used only three racial categories. (If you consider gender, four subcategories exist; if you include age, there are five categories.) These categories reflect the de facto color line (and gender/age lines) operating in U.S. society at that time:

- Free whites (males under 16 years old, males over 16 years old, females)
- All other free persons (e.g., Native Americans who paid taxes and free blacks)
- Enslaved people

Although southern states fought to define slaves as property in all other matters (e.g., see *Missouri v. Celia* in Chapter 4), they argued the opposite about census counts because states with more people would get more political power and resources. Such an arrangement would advantage slave holding states and, presumably, give them a reason to enslave more people (Blank et al., 2004). Northern and southern states made a compromise to count slaves as three fifths of a person to distribute power more equitably, writing that “direct Taxes shall be apportioned among the several States . . . by adding to the whole Number of free Persons excluding Indians not taxed, three fifths of all other Persons” (Blank et al., 2004, p. 206).

In addition to telling us about the population, census categories also tell us how people think about race at any given time. For example, the first census taken after the Civil War ended used these categories: White, Black, Mulatto, and Indian. (The category of “Mulatto” applied to people with unspecified “mixed” racial heritage.) By 1890, the categories changed, again, to

- **White**
- **Black** (a person defined as more than three-fourths Black)
- **Mulatto** (a person classified as three-eighths to five-eighths Black)
- **Quadroon** (*quad* meaning four, or one-fourth Black)
- **Octoroons** (*octo* meaning eight; that is, people defined as one-eighth or as having any other amount of “Black blood”)
- **Indian**
- **Chinese**
- **Japanese**

The addition of Chinese and Japanese categories reflects Asian immigration to the United States. The subcategories of *quadroon* and *octoroon* were an attempt to measure race in more detail, but still along a Black–white dichotomy (Blank et al., 2004), and reflect concerns about the impact of newly freed slaves on U.S. society (Hochschild & Powell, 2008). Specifically, lawmakers sought “to ascertain and exhibit the physical effects upon offspring resulting from the amalgamation of human species” and see if “the mulattoes, quadroons, and octoroons are disappearing and the race becoming more purely Negro” (Hochschild & Powell, 2008). While census takers were advised to “be particularly careful to distinguish between blacks, mulattoes, quadroons, and octoroons,” they were not told how to determine those specific fractions of “black blood” (Hochschild & Powell, 2008).

Identifying the amount of “Blackness” was more complicated than it sounded, and the census didn’t use those categories again. However, southern states continued efforts to do so by introducing the “one-drop rule.” Under this law, a person with any trace of Black ancestry, even “one drop” of African blood, was defined as Black and subject to the limitations of extreme racial inequality. Thus, it rigidly solidified the Black–white color line in law and in custom.

The racial categories for Black Americans and other groups continued to change over the years—most notably for Black Americans (see Figure 1.7). The Census Bureau continues to add ethnic...
categories as new immigrants come to the United States. For now, ethnic categories fall under one of these “racial” categories: white, Black/African American, Native American/Alaskan Native, Asian (e.g., Chinese, Japanese, Korean), Native Hawaiian and Pacific Islander (e.g., Samoan, Chamorro), and other. The Census Bureau notes that people of Hispanic origin may be of any race. Therefore, it asks people of Hispanic origin to identify their place of origin such as Cuba, Puerto Rico, or Mexico.

The census has changed in other ways, too. In 1960, the Census Bureau mailed its form to urban residences and for the first time, respondents could choose their racial identity. (In prior decades, the census taker determined each person’s race. This change was important for giving people agency to self-identify their race, but it may also have produced more accurate information. That is, given the prejudice and discrimination against nonwhites, people may have been more likely to choose white when the census taker was nearby.) The first census to ask about Hispanic origin happened in 1980. The 2000 census was the first to allow people to identify as multiracial by selecting more than one category (Lowenthall, 2014). For example, someone could identify as white and Cuban.

Yet even with these changes, the category of “white” has remained remarkably consistent over time (see Figure 1.7). Nor has it included gradations of “whiteness”; that is, there are no subcategories of “whiteness” as there were of “blackness” in 1890, for example (Blank et al., 2004). Thus, we might consider the U.S. construction of race as involving a white—nonwhite color line (i.e., white is a dominant, nonchanging category) that reflects assumptions of black inferiority made at the heart of U.S. slavery and Jim Crow segregation.

Despite its scientific limits, the idea of race continues to shape intergroup relations in America and globally. Race, along with gender, is one of the first things people notice about one another. Because race is still a significant way of differentiating people, it remains socially important. In addition to discrimination by out-group members, ideas about race can also shape relations within a perceived racial group. For example, people within groups and outside of them may see lighter skinned Black Americans as superior to darker skinned Black Americans; thus, they may treat lighter skinned people better. Walker (1983) named this colorism. Such discrimination reflects the dominant racial hierarchy that prefers lighter skin tone and presumed European facial features and body types (Harris, 2008, p. 54). While an important area of study, we (like other researchers) focus on broadly defined racial groups that affect all group members (see Blank et al., 2004, p. 29).

So, how does the idea of race remain relevant? Because of the way they developed, Western concepts of race have social and biological dimensions. Sociologists consider race a social construction whose meaning has been created and sustained not by science but by historical, social, economic, and political processes (see Omi & Winant, 1986; Smedley, 2007). For example, in Chapter 4, we’ll analyze the role of race in the creation of American slavery and you’ll see that the physical differences between Blacks and whites became important as a result of that system of inequality. The elites of colonial society needed to justify their unequal treatment of Africans and seized on the visible differences in skin color, elevated it to a matter of supreme importance, and used it to justify the enslavement of Blacks. That is, the importance of race was socially constructed as the result of a particular historical conflict, and it remains important not because of objective realities, but because of the widespread, shared social perception that it is important.

**Gender**

You’ve seen that groups can be internally differentiated by social class and other factors (e.g., sexual orientation). Gender is another source of differentiation. Like race, gender has visible and socially meaningful components that make it convenient for categorizing people and organizing society. Historically, people have used visible biological characteristics such as genitalia to assign people into two sexes, female or male. (Almost 2% the U.S. population are intersex, having have biological characteristics from more than one sex category [see Fausto-Sterling, 1993].)

Americans primarily recognize two gender statuses: boy/man and girl/woman. Babies are given a gender based on their sex. For example, when a fetal ultrasound for sex shows a penis, people declare, “It’s a boy!” As you’ll learn, gender is also a social construct. These ideas about what is masculine or
feminine influence gender norms, or societal expectations about proper behavior, attitudes, and personality traits.

Gender norms vary across time and from one society to another, but sociologists and other social scientists have documented the close relationship between gender and inequality. Typically, men (as a group) have more property, prestige, and power than women. Figure 1.8 provides some perspective on the global variation in gender inequality. The map shows the Gender Gap Index, a statistic that measures the amount of inequality between women and men based on variables such as education, labor market participation, reproductive health (e.g., maternal mortality rate), and political representation. As you can see, gender equality is generally highest in the more industrialized nations of North America and Western Europe and lowest in the less developed, more agricultural nations of Africa (e.g., Niger, Mali, Democratic Republic of Congo, Côte d’Ivoire, Liberia, Sierra Leone, Gambia, Mauritania, Benin) and the Middle East (e.g., Yemen, Afghanistan, Saudi Arabia, Egypt, Syria, Iran).

Although Western European and North American societies rank relatively high on gender equality, gender discrimination continues to be a major issue in many of them, as you’ll see throughout this book (Chapter 11 in particular). For example, a consistent—and large—gender income gap persists, and women are decidedly underrepresented in the most lucrative and powerful occupations (see Figure 11.1). While many societies have made progress, gender inequality appears likely to continue for generations.

Part of the problem is that all societies, including Western European and North American ones, have strong histories of patriarchy, or systems of dominance by men. As with racial and class stratification, dominant groups have greater resources. In patriarchal societies, men (as a group) have more control over the economy and more access to leadership roles in business, politics, education, and other institutions. Parallel to forms of racism that sought to justify and maintain racial inequality, sexism is an ideology that justifies and maintains gender inequality. For example, people in some societies view women as “delicate,” “too emotional,” and physically weak for the demands of “manly” occupations. (In the United States and other societies, these ideas about gender were also racialized, applying only to white women. The same men who placed white women “on a pedestal” didn’t hesitate to send enslaved women into the fields to perform the most difficult, physically demanding tasks.)

Even in the most progressive societies, women possess many characteristics of a minority group, especially a pattern of disadvantage based on group membership marked by visible characteristics. Thus, we consider women to be a distinct minority group and we’ll examine gender throughout the

---

**FIGURE 1.8 Gender Inequality Worldwide**

![Map of global gender inequality](image)

book and in, especially in Chapter 11. In keeping our intersectional approach, we'll address women's and men's experiences within each racial or ethnic minority group, as well. As stressed in the intersectional approach, the experience of racial or ethnic minority group membership varies by gender (and other social statuses such as age, class). Likewise, the way gender is experienced isn't the same for every racial or ethnic (or other) group. Therefore, some Black women may share common interests and experiences with white women and different interests and experiences compared to Black American men. In other cases, those constellations of interests and experiences would vary. Those in power generally write about history from their own standpoint—ignoring, forgetting, or trivializing minority group experiences. For instance, slave owners wrote much of the history of slavery. Laws against education kept enslaved people illiterate, leaving few mechanisms for recording their thoughts or experiences. A more accurate picture of slavery has emerged only since the mid-20th century, when scholars started to reconstruct the experiences of enslaved Africans from nonwritten documentation (such as oral traditions, including folklore and songs) and from physical artifacts (such as quilts, pottery, and religious objects; e.g., see Fennell, 2013; Levine, 1977).

Despite these advances, the experiences of women minorities are much less well known and documented than men's. One important trend in contemporary scholarship is to correct this skewed focus by systematically incorporating gender as a vital factor for understanding minority group experiences (Baca Zinn & Thornton Dill, 1994; Espiritu, 1996).

**The Social Construction of Gender**

Social scientists see race as a social construction created under certain historical circumstances (e.g., slavery) when it was needed to justify the unequal treatment of nonwhite groups. What about gender? Have socially created ideas enabled and rationalized men's higher status and their easier access to power, prestige, and property? Figure 1.8 shows that every nation has some degree of gender inequality—though it varies a lot. Does that inequality result from popular ideas about gender? For example, are boys and men “naturally” more aggressive, competitive, and independent, and girls and women “naturally” more cooperative, helpful, and fragile? Where do these ideas come from? If gender isn't a social construction, why do ideas about what girls/women and boys/men are like vary across time (e.g., 1400, 1776, 2019) and place (e.g., China, Afghanistan, Sweden)? Why do ideas about what they should and shouldn't do vary? And why does gender inequality vary? Many people look to the role of biology when explaining such variation. Yet, if people's biology (e.g., chromosomes, hormones) is fairly constant across time and location, wouldn't gender be as well? Let's dig a bit deeper.

First, the traits people commonly see as typical for women or men aren't disconnected, separate categories. Every person has them, to some degree. To the extent that gender differences exist at all, they are manifested not in absolutes but in averages, tendencies, and probabilities. Many people consider aggressiveness a masculine characteristic, but some women are more aggressive than some men. As with race, research shows that there is more variation within categories (e.g., all women, all men) than between them—a finding that seriously undermines the view that gender differences are biological (Basow, as cited in Rosenblum & Travis, 2002).

Second, gender as a social construction is illustrated by the fact that what people think is “appropriate” behavior for women and men varies over time and from society to society. The behavior people expected from a woman in Victorian England isn't the same as those for women in 21st-century America. Likewise, the gender norms for men in 500 CE China are different from those in Puritan America. This variability makes it difficult to argue that the differences between the genders are hard-wired in the genetic code; if they were, these variations wouldn't exist.

Third, the relationship between subsistence technology and gender inequality illustrates the social nature of gender norms. As noted previously, humans evolved in East Africa and relied on hunting and gathering to meet their basic needs. Our distant ancestors lived in small, nomadic bands that relied on cooperation and sharing for survival. Societies at this level of development typically divided adult labor by gender (often men hunting, women gathering). Because everyone's work was crucial to survival, gender inequality was minimal (Dyble et al., 2015). Women's subordination seems to have emerged
with settled agricultural communities, the first of which appeared about 10,000 years ago in what is now the Middle East. People in preindustrial farming communities didn’t roam, and people could accumulate (and store) wealth (see Dyble et al., 2015). Survival in these societies required the combined labor of many people; thus, large families were valued. Women became consigned to domestic duties, especially having and raising children. Because the infant mortality rate in these societies was high (approximately 50% or more), women spent much of their lives confined to their homes, pregnant or nursing, far removed from the possibility of participating in other extra-domestic life, such as contending for community leadership roles.

Industrialization and urbanization, linked processes that began in the mid-1700s in Great Britain, changed the cost–benefit ratios of childbearing. As people moved to cities, the expense of having children rose, and work increasingly required education and literacy—both for women and men. As women increasingly participated in life outside of their homes, they gained additional resources (e.g., income, networks) that put them on more level footing with men. Thus, it’s probably not surprising that the push for gender equality is associated with industrial societies and that gender equality is highest in industrial and postindustrial societies (see Figure 1.7).

Researchers continue to explore the links between biology and gender (e.g., see Hopcroft, 2009; Huber, 2007; Udry, 2000). However, at its core, gender is primarily social, not biological. Gender, like race, is a social construction, especially when people treat the supposed differences between men and women as categorical, natural, and fixed and then use those ideas to deny opportunity and equality to women (Booth et al., 2006, pp. 167–191; see also Ridgeway, 2011, pp. 18–23).

**QUESTIONS FOR REFLECTION**

9. How do gender and race exist apart from people’s perceptions of them? How are these constructs similar? Different? Are they equally matters of perception?

**KEY CONCEPTS IN DOMINANT–MINORITY RELATIONS**

When people discuss issues such as dominant–minority group relations, the discussion often turns to matters of prejudice and discrimination. This section introduces and defines four concepts to help you understand dominant–minority relations in the United States.

This book addresses how individuals from different groups interact and how groups interact with each other. Thus, we need to distinguish between what is true for individuals (the more psychological level of analysis) and what is true for groups or society (the sociological level of analysis). Additionally, it’s helpful to connect these levels of analysis.

At the individual level, what people think and feel about other groups may differ from how they behave toward members of another group. A person might express negative feelings about other groups in private but deal fairly with group members in face-to-face interactions. Groups and entire societies may display similar inconsistencies. A society may express support for equality in its official documents (e.g., laws) while simultaneously treating minority groups in unfair, destructive ways. For example, contrast the commitment to equality stated in the Declaration of Independence (“All men are created equal”) and the actual treatment of enslaved Africans, Anglo American women, and Native Americans at that time.

At the individual level, social scientists refer to the thinking/feeling part of this dichotomy as *prejudice* and the doing part as *discrimination*. At the group level, the term *ideological racism* describes the thinking/feeling dimension and *institutional discrimination* describes the doing dimension. Table 1.1 depicts the differences among these four concepts.

**Prejudice**

Prejudice is the tendency of an individual to think about some groups in negative ways, to attach negative emotions to those groups, and to prejudge individuals based on their group memberships.
On January 6, 2021, thousands of supporters of then-President Trump attacked the U.S. Capitol building. Many were members of right-wing extremist and hate groups, and came bearing racist symbols.

Individual prejudice has two aspects: **cognitive prejudice**, or the thinking aspect, and **affective prejudice**, or the feeling part. A prejudiced person thinks about other groups in terms of **stereotypes** (cognitive prejudice), generalizations that they think are true for all group members. Examples of familiar stereotypes include notions such as “women are emotional,” “Jews are stingy,” “Blacks are lazy,” and “the Irish are drunks.” A prejudiced person also experiences negative emotional responses to other groups (affective prejudice), including contempt, disgust, arrogance, and hatred.

People vary in their levels of prejudice, and levels of prejudice vary in the same person from one time to another and from one group to another. We can say that people are prejudiced to the extent that they use stereotypes in their thinking about other groups or have negative emotional reactions to other groups.

The two dimensions of prejudice are highly correlated with each other; however, they are distinct and separate aspects of prejudice and can vary independently. One person may think entirely in stereotypes but feel no particular negative emotional response to any group. Another person may feel a strong aversion toward a group but be unable to articulate a clear or detailed stereotype of that group.

Individual prejudice, like all aspects of society, evolves and changes. Historically, Americans’ prejudice was strongly felt, overtly expressed, and laced with detailed stereotypes. Overt forms declined after the civil rights era of the 1950s and 1960s but didn’t disappear and vast numbers of Americans came to view them as problematic. In modern societies that emphasize mutual respect and tolerance, people tend to express prejudice in subtle, indirect ways. Prejudice might manifest in language that functions as a kind of code (for instance, when people associate “welfare cheats” or criminality with certain minority groups). We’ll explore modern forms of prejudice in Chapter 3, but we need to be clear that you should not mistake the general decline of blatant prejudice against minority groups in modern society for its disappearance. As you’ll see throughout the book, many traditional forms of prejudice and discrimination have reasserted themselves in recent years.

**Discrimination**

Discrimination is the unequal treatment of people based on their group membership. For example, an employer might not hire someone because they are Black (or Jewish, Chinese, gay, etc.). If the unequal treatment is based on the individual’s group membership (e.g., race/ethnicity, gender, sexual orientation, religion), the act is discriminatory.

Just as the cognitive and affective aspects of prejudice can be independent, discrimination and prejudice don’t necessarily occur together. Even highly prejudiced individuals may not act on their negative thoughts or feelings. In social settings regulated by strong egalitarian codes or laws (e.g., restaurants and other public facilities), people who are highly bigoted in their private thoughts and feelings may
follow the norms in public. However, when people approve of prejudice in social situations, such support can produce discrimination from otherwise unprejudiced individuals. In the southern United States during the height of segregation and in South Africa during the period of state-sanctioned racial inequality called *apartheid*, it was usual and customary for white people to treat Black people in discriminatory ways. Regardless of individuals’ actual level of prejudice, they faced strong social pressure to conform to the official forms of racial superiority and discrimination.

**Ideological Racism**

Ideological racism is a belief system asserting that a particular group is inferior; it is the group or societal equivalent of individual prejudice. Members of the dominant group use ideological racism to legitimize or rationalize the unequal status of minority groups. Through the process of socialization, such ideas pass from generation to generation, becoming incorporated into the society’s culture. It exists separately from the individuals who inhabit the society (Andersen, 1993, p. 75; See & Wilson, 1988, p. 227). An example of a racist ideology is the elaborate system of beliefs and ideas that attempted to justify slavery in the American South. Whites explained their exploitation of slaves in terms of the supposed innate racial inferiority of Blacks and the superiority of whites.

In later chapters, we’ll explore the relationship between individual prejudice and racist ideologies at the societal level. For now, we’ll make what may be an obvious point: People socialized into societies with strong racist ideologies are likely to internalize those ideas and be highly prejudiced; for example, a high level of personal prejudice existed among whites in the antebellum American South or in other highly racist societies, such as in South Africa under apartheid. Yet, ideological racism and individual prejudice are different phenomena with different causes and different locations in the society. Racism isn’t a prerequisite for prejudice and prejudice can exist in the absence of racist ideology.

**Institutional Discrimination**

Institutional discrimination is the societal equivalent of individual discrimination. It refers to a pattern of unequal treatment, based on group membership, built into the daily operations of society, whether or not it is consciously intended. Public schools, the criminal justice system, and political and economic institutions can operate in ways that put members of some groups at a disadvantage.

Institutional discrimination can be obvious and overt. For many years following the American Civil War, practices such as poll taxes and rigged literacy tests (designed to ensure failure) prevented Black Americans in the South from voting. Well into the 1960s, elections and elected offices in the South were restricted to whites only. The purpose of this blatant pattern of institutional discrimination was widely understood by Black and white southerners alike: It existed to disenfranchise the Black community and to keep it politically powerless (Dollard, 1937).

At other times, institutional discrimination may operate subtly and without conscious intent. For example, if schools use biased aptitude tests to determine which students get to take college preparatory courses, and if such tests favor the dominant group, then the outcomes are discriminatory—even if everyone involved sincerely believes that they are merely applying objective criteria in a rational way. If a decision-making process has unequal consequences for dominant and minority groups, institutional discrimination may well be at work.

Although individuals may implement and enforce a particular discriminatory policy, it is better to recognize it as an aspect of the institution. For example, election officials in the South during segregation didn’t (and public school administrators today don’t) have to be personally prejudiced to implement discriminatory policies.

However, a major thesis of this book is that racist ideologies and institutional discrimination are created to sustain the stratification system. Widespread institutional discrimination maintains the relative advantage of the dominant group. Members of the dominant group who are socialized into communities with strong racist ideologies and a great deal of institutional discrimination are likely to be personally prejudiced and to routinely engage in acts of individual discrimination. The mutually reinforcing patterns of prejudice, racism, and discrimination on the individual and institutional levels preserve the respective positions of dominant and minority groups over time.
Institutional discrimination is one way that members of a minority group can be denied access to goods and services, opportunities, and rights (such as voting). That is, institutional discrimination helps sustain and reinforce the unequal positions of racial and ethnic groups in the stratification system.

**QUESTIONS FOR REFLECTION**

10. Like most Americans, you are probably familiar with the stereotypes associated with various groups. Does this mean you are prejudiced against those groups? Does it mean you have negative emotions about those groups and are likely to discriminate against them? Explain.

11. In general, would you say that whiteness is “the norm” in U.S. society? Is racial identity “invisible” to whites? How does racial privilege permit white people to ignore race?

**A GLOBAL PERSPECTIVE**

In future chapters, we’ll discuss additional concepts and theories and apply those ideas to minority groups in the United States. However, it is important to expand our perspective beyond our country. Therefore, we’ll also apply our ideas to the histories and experiences of other peoples and places. If the ideas and concepts developed in this book can help us make sense of intergroup relations around the world, we’ll have some assurance that they have some general applicability and that the dynamics of intergroup relations in the United States aren’t unique.

On another level, we must also take into account how economic, social, and political forces beyond our borders shape group relations in the United States. As you’ll see, American society can’t be understood in isolation because it is part of the global system of societies. Now, more than ever, we must systematically analyze the complex interconnections between the domestic and the international, particularly with respect to immigration issues. The next section explores one connection between the global and the local.

**Immigration and Globalization**

Immigration is a major concern in our society today, and we’ll address the issue in the pages to come. Here, we’ll point out that immigration is a global phenomenon that affects virtually every nation in the world. About 272 million people—about 3.5% of the world’s population—live outside their countries of birth, and the number of migrants has increased steadily over the past several decades (International Organization for Migrants, 2020). Figure 1.9 illustrates the global nature of the migration by listing the top 20 destinations for migrants (on the left) and the top 20 nations of origin on the right. Note that the United States and Western European nations are well represented among the receiving nations but so are other nations from around the globe. The sending nations come from every continent and area, including Asia, Central America, and Africa.

What has caused this massive population movement? One very important underlying cause is globalization, or the increasing interconnectedness of people, groups, organizations, and nations. This process is complex and multidimensional, but perhaps the most powerful dimension of globalization—especially for understanding contemporary immigration—is economics and the movement of jobs and opportunity from place to place. People flow from areas of lower opportunity to areas with greater opportunity.

To illustrate, consider the southern border of the United States. For the past several decades, there’s been an influx of people from Mexico and Central America, and the presence of these newcomers has generated a great deal of emotional and political heat, especially because many of these migrants are undocumented.

Some Americans see these newcomers as threats to traditional American culture and the English language, and may associate them with crime, violence, and drug smuggling. Others see them simply as people trying to survive as best they can, desperate to support themselves and their families. Few, however, see these immigrants as the human consequences of the economic globalization of the world.

What is the connection between globalization and this immigrant stream? The population pressure on the southern border has been in large part a result of the North American Free Trade Agreement (NAFTA), implemented in 1994. NAFTA united the three North American nations in a single trading
bloc—economically globalizing the region—and permitted goods and capital (but not people) to move freely among Canada, the United States, and Mexico.

Among many other consequences, NAFTA opened Mexico to the importation of food products produced at very low cost by the giant agribusinesses of Canada and the United States. This cheap food (corn in particular) destroyed the livelihoods of many rural Mexicans and forced them to leave their villages in search of work. Millions pursued the only survival strategy that seemed at least remotely sensible: migration north. Even the worst job in the United States pays many times more than the average Mexican wage.

Even as NAFTA changed the economic landscape of North America, the United States became increasingly concerned with the security of its borders (especially after the terrorist attacks of September 11, 2001) and attempted to stem the flow of people, partly by building fences and increasing the size of the Border Patrol. The easier border crossings were quickly sealed, but this didn’t stop the pressure from the south. Migrants moved to more difficult and dangerous crossing routes, including the deadly, forbidding Sonoran Desert in southern Arizona, resulting in an untold number of deaths on the border since the mid-1990s. Since then, immigration has continued to be a concern for Americans. President Donald Trump used this concern as one of his major appeals to voters in his 2016 election campaign. In July 2020, NAFTA was replaced by the United States–Mexico–Canada Agreement (USMCA). At the time of writing, it’s too early to tell what the effects will be or how the policy might change under the Biden administration.

Figure 1.10 displays one estimate of recent deaths in southern Arizona, but these are only the bodies that have been discovered. Some estimates put the true number at 10 deaths for every recovered corpse, suggesting that that approximately 34,000 migrants have died in Arizona since the mid-1990s.

The relationship between NAFTA and immigration to the United States is only one aspect of a complex global relationship. Around the world, significant numbers of people are moving from less industrialized nations to those with more affluent economies. The wealthy nations of Western Europe, including Germany, Ireland, France, and the Netherlands, are also receiving large numbers of
Between October, 1999 and December 2019 Humane Borders collected data on 3496 migrant deaths. Some dots represent more than one death. Over the past 20 years, Humane Borders deployed equipment for over 80 water stations at remote, strategic locations in Mexico and the USA.

Source: Humane Borders (2020).
immigrants, and many citizens of these nations are concerned about their jobs, communities, housing, and language—and the integrity of the national cultures changing in response. Many Americans have similar concerns. The world is changing, and contemporary immigration must be understood in terms of changes that affect many nations and, indeed, the entire global system of societies.

QUESTIONS FOR REFLECTION

12. How does globalization spur immigration? Consider examples outside of the United States, too (e.g., from Africa to Europe).

13. What are the most significant challenges new immigrants will face in the United States and why? Consider the following: (a) Transportation, (b) Communication, (c) Finding a job that pays enough and that you can walk to or is on the bus line, (d) Household matters (e.g., cleaning, food), (e) Safety, (f) Finances (e.g., getting a bank account), (g) Relationships (e.g., friends, dating), and (h) Education. How might prejudice or discrimination influence these challenges?

14. Some people make a distinction between “deserving immigrants” and “undeserving immigrant” (Aptekar, 2015, p. 112). What do you make of this distinction? What are the most important factors to consider when deciding which immigrants to let in. How important are “merits” such as English fluency, education, and religion? How important are other factors such as humanitarian needs for safety or the ability to find work that enables people to obtain food and shelter?

CONCLUSION

Our goal in writing this book is to teach you how to apply the sociological perspective to the world around you. With the concepts, theories, and body of research developed over the years, we can illuminate and clarify the issues. In many cases, we can identify approaches and ideas that are incorrect and those that hold promise. This chapter raises many questions. Sociology can’t answer all questions, but it provides important research tools and ideas to help you think with greater depth and nuance about the issues facing our society and the world.

SUMMARY

We’ve organized this summary around the Learning Objectives at the beginning of the chapter.

1.1 Explain the increasing racial and ethnic diversity of the United States.

Rates of immigration are high, and, as shown in Figure 1.1, non-Hispanic white Americans are declining in relative size. By midcentury, they will no longer be a numerical majority of the U.S. population. (Which groups are increasing in relative size? What will the United States look like in the future in terms of ethnicity, race, culture, language, and cuisine?)

Rates of marriage across group lines are also increasing, along with the percentage of the population that identifies with more than one racial or ethnic group. Groups that do not fit into the categories in Figure 1.1 (e.g., Arab Americans, immigrants from Africa) are growing in size.

Many of the grievances and problems that affect American minority groups (e.g., African Americans, Native Americans, and Hispanic Americans) have not been resolved, as we shall see in Part 3 of this text.

1.2 Understand the concept of a minority group.

A minority group has five characteristics. Members of the group

- experience a pattern of disadvantage, which can range from mild (e.g., casual snubs or insults) to severe (e.g., slavery or genocide);
• have a socially visible mark of identification which may be physical (e.g., skin color), cultural (e.g., dress, language), or both;
• are aware of their disadvantaged status;
• are generally members of the group from birth; and
• tend to form intimate associations within the group.

Of these traits, the first two are the most important.

1.3 Explain the sociological perspectives that will guide this text, especially as they relate to the relationships between inequality and minority-group status.

A stratification system has three different dimensions (class, prestige, and power), and the nature of inequality in a society varies by its level of development. Minority groups and social classes are correlated in many complex ways. Minority groups generally have less access to valued resources and opportunity. However, minority status and inequality are separate and may vary independently. Members of minority groups can be differentiated by gender, social class, and many other criteria; likewise, members of a particular social class can vary by gender, race, ethnicity, and along many other dimensions.

1.4 Explain how race and gender contribute to minority-group status.

Visible characteristics such as skin color or anatomy are widely used to identify and differentiate people (e.g., woman/man, black/white/Native American/Asian/Latino). So-called racial characteristics, such as skin color, evolved as our ancestors migrated from East Africa and spread into new ecologies. During the period of European colonization of the globe, racial characteristics became important markers of “us and them,” conqueror and conquered.

Race and gender are socially constructed ideas that become filled with social meaning (e.g., strong, nurturing, smart, lazy). These meanings change over time and across geographic location. Although they are just ideas, these social constructions feel “natural” and “real.” Thus, they powerfully influence the way we think about one another. They influence minority-group membership and, therefore, one’s life chances such as access to resources and privilege (e.g., education, legal rights, pay, prestige). Sexism and racism attempt to explain patterns of gender and racial inequality in terms group members’ “inferiority.”

1.5 Comprehend four of the key concepts in dominant–minority relations: prejudice, discrimination, ideological racism, and institutional discrimination.

This text analyzes dominant–minority relationships at both the individual and societal levels. Prejudice refers to individual feelings and thoughts while discrimination is different treatment of people based on their group membership. Individual discrimination is behavior done by individuals. Ideological racism and institutional discrimination are parallel concepts that refer to prejudice and discrimination at the societal level.

1.6 Apply a global perspective to the relationship between globalization and immigration to the United States.

A global perspective means that we will examine dominant–minority relations not just in the United States but in other nations as well. We will be sensitive to the ways group relations in the United States are affected by economic, cultural, political, and social changes across the global system of societies. The relationship between USMCA (which replaced NAFTA) and immigration to the United States illustrates one of the many connections between domestic and international processes.

**KEY TERMS**

- affective dimension of prejudice
- ascribed status
- bourgeoisie
- cognitive dimension of prejudice
- discrimination
- dominant group
- ethnic minority groups
- gender norms
genocide  
ideological racism  
imcurational discrimination  
intersectionality  
level of development  
means of production  
minority group  
miscegenation  
patriarchy  
postindustrial society  
power  

prejudice  
prestige  
proletariat  
racial minority groups  
sexism  
social classes  
social constructions  
social mobility  
 stereotypes  
stratification  
subsistence technology

APPLYING CONCEPTS

We list real and hypothetical events below. Identify which are examples of cognitive prejudice, affective prejudice, individual discrimination, ideological racism, or institutional discrimination, and briefly explain your reasoning. Some incidents may include elements that reflect more than one concept.

*Note:* Your instructor may ask you to complete this assignment with others as a group discussion.

REVIEW QUESTIONS

1. What is the significance of Figure 1.1? What are some of the limitations and problems with the group names it uses? How are the group names social constructions? Does increasing diversity in the United States represent a threat, an opportunity, or both? Should we celebrate group
differences, or should we strive for more unity and conformity? What are the advantages and disadvantages of stressing unity and conformity? Explain your answers in detail.

2. Wagley and Harris developed their five-part definition of a minority group with racial and ethnic minorities in mind. What other groups share those five characteristics? For example, which characteristics apply to religious groups such as Mormons or Muslims? To people who are left-handed, very overweight, or very old? Why is it useful or significant to consider other groups beyond racial, ethnic, class, and gender-based groups?

3. What is a social construction? As social constructions, how are race and gender the same and how do they differ? What does it mean to say, “Gender becomes a social construction—like race—when it is treated as an unchanging, fixed difference and then used to deny opportunity and equality to women”? Consider the changing social constructions of race over time suggested by the Census Bureau categories. What do you make of them? Which categories make sense to you and why? How do those categories reflect particular meanings or ways of thinking at the time?

4. When analyzing dominant–minority relations, why is it important to take a global perspective? What can we learn by looking outside the United States? Besides immigration, how does globalization shape dominant–minority relations in the United States?

5. Explain the terms in Table 1.1. Cite an example of each from your own experiences, those of someone you know, or from current events, then compare them. How does ideological racism differ from prejudice? How does institutional discrimination differ from individual discrimination? Why is it important to analyze the societal level in addition to the individual level?

<tr>
<td>1 Cognitive prejudice</td>
<td>Mrs. James seems to be thinking in terms of the traditional stereotype regarding the desirability of Black and Hispanic Americans.</td>
</tr>
<tr>
<td>2 Discrimination</td>
<td>These hostile behaviors are targeted toward members of the local mosque because of their membership in the group, Muslims. The sign on the door is clear; the bacon reflects the rejection of Islamic guidelines against eating pork. It defiles the mosque.</td>
</tr>
<tr>
<td>3 Institutional discrimination</td>
<td>In this case, the Secret Service appears to have had a discriminatory policy. This discrimination reflects a broad pattern of treatment, not an individual action.</td>
</tr>
<tr>
<td>4 Cognitive prejudice</td>
<td>Mr. Smith uses stereotypical thinking about women as more interested in family issues than work-related ones a human resources director might need to address. Although he sees Ms. Washington as a “tough broad” he puts her in the category of “emotional women.”</td>
</tr>
<tr>
<td>5 Institutional discrimination</td>
<td>This example comes from an analysis of Chicago policing that suggested a pattern of unequal treatment for Blacks there. Institutional discrimination can be overt (e.g., laws requiring segregated schools). At other times, it’s subtle. Behaviors that lead to inequality don’t have to be intentional to be discriminatory.</td>
</tr>
<tr>
<td>6 Affective prejudice</td>
<td>Professor Jones is expressing strong feelings of anger and contempt for students. (She’s also stereotyping them as lazy.)</td>
</tr>

ENDNOTES

1 When we use America or American, we are referring to the United States of America and its citizens. We recognize that people living in North and South America are also Americans.

2 We sometimes use quotation marks to indicate social constructs or widely held beliefs about what is real or true. For example, “race” or “Caucasian.”
3 LGBTQIA stands for lesbian, gay, bisexual, transgender, queer/questioning, intersex, and asexual/allied.

4 Boldfaced terms are also defined in the glossary at the end of the book.
