Stalemate over the debt ceiling. Conflicts between the White House and Congress over policy issues are not unusual, particularly when the opposition party controls one or both houses of Congress. The photo shows House Speaker Kevin McCarthy (R-CA) and Senate Majority Leader Charles Shumer (D-NY) in a meeting with President Joe Biden and Vice President Kamala Harris about raising the debt ceiling in the Oval Office on May 16, 2023.

GOVERNMENT INSTITUTIONS AND POLICY ACTORS
LEARNING OBJECTIVES

- Describe and explain the growth of government throughout U.S. history.
- Analyze the structure of the U.S. government and the implications for policymaking capacity.
- Explain the challenges of policymaking posed by the separation of powers.
- Describe and assess major governmental and nongovernmental actors most involved in the policy process.
- Examine ways to improve governmental policy capacity.
- Assess how citizen involvement can make a difference in policy development.

In late 2019, public health officials from around the world began to pay attention to the development and spread of a new novel coronavirus. The spread was small at first, but then a large cluster appeared in Wuhan, China, in December 2019. By spring 2020, the virus, now known as COVID-19 (CO for corona, VI for virus, D for disease, and 19 for the year the outbreak was first recognized), had spread throughout the world, including into the United States. In 2020, the World Health Organization (WHO) declared the COVID-19 outbreak a pandemic.\(^1\)

The airborne virus spread quickly, causing illness and, in some cases, death. The first confirmed death in the United States occurred in February 2020. By March 2020, COVID cases reached over 100,000 worldwide and were spreading rapidly. By mid-March, the United States had declared a state of emergency, and the virus led to serious consequences across the country. Most universities and K–12 schools pivoted to remote teaching in order to ensure that students were not together in classrooms and dorms. On March 12, Broadway went dark after New York State and city leaders restricted gatherings of more than 500 people. While the shutdown was initially to last for thirty-two days, ultimately it was extended to May 2021.\(^2\) Restaurants, offices, meat-packing companies, and many other establishments initially closed their doors to in-person business, hoping that doing so would curb the virus’s spread, at least temporarily. We know now that much of the nation was “shut down” for much longer than expected and that the pandemic continued to affect daily life and the economy. By fall 2022, the United States had seen over 93 million cases of COVID-19, with over 1 million deaths attributed to the virus.\(^3\)

What was the government’s response to this major health crisis? And what kind of activities or actions might we have expected to protect public health, an area of public policy in which the government has been highly involved for decades? Both questions have complicated answers. Actions on public health span different governmental levels and agencies and are a good illustration of the complexity of policymaking today. For example, multiple federal agencies have public health responsibilities, including the Centers for Disease Control and Prevention (CDC), the Department of Health and Human Services (HHS), and the Food and Drug Administration (FDA), among many others (see Chapter 8). Each has its own area of responsibility, even if they overlap to some extent. For example, the CDC serves as the nation’s public health agency and
studies diseases and their cures; it also provides health information to the public. The FDA supports the development of pharmaceuticals, and it is responsible for their safety. This includes the vaccines that were developed to protect against COVID infections. Beyond the federal government, state and local public health agencies also are involved in the protection of health for their local populations, reflecting the nature of U.S. federalism, where multiple levels of government often have responsibilities that overlap.

Because the virus was new, public health officials initially were at a disadvantage in trying to prevent its spread. Various levels of government, and the private sector, pursued different policies to ensure that people were not in close contact and thus likely to spread the virus. This included requirements to work from home, children to attend schools virtually, and for everyone to try to maintain sufficient distance between themselves and others, usually defined as six feet. Among other questions that arose was whether face masks should be encouraged or in some cases made mandatory. Some asked if they needed to be used at all. The answers to all of these questions were up in the air, as scientists continued to learn more about the airborne spread of the virus. Public health officials also were concerned about the sufficiency of the nation’s initially limited supply of face masks, and they pressed to ensure that the masks go first to those most directly affected by the pandemic, such as health care providers. Early in the pandemic, there was no vaccine for COVID-19, and thus, officials either required or encouraged citizens to follow various nonpharmaceutical actions. Health agencies encouraged people to practice typical good hygiene and increase the amount of surface cleaning (leading to a supply problem for items such as Clorox wipes and other disinfectants). For a while, some officials even encouraged people to clean their groceries to protect against droplets from others that might be on the surface before we learned that transmission of the virus was largely airborne.

On the vaccine front, the government supplied substantial funds to a number of pharmaceutical companies in an attempt to rapidly develop a vaccine as well as effective treatments for those already infected. By the late fall of 2020, several companies had developed vaccines and were evaluating their efficacy and safety and were beginning the approval process for them through the FDA. The year 2020 also brought a presidential election, with sitting President Donald Trump running against former Vice President Joe Biden. Throughout the spread of COVID, critics faulted the Trump administration for its response to the public health crisis. Many administration officials, including the president himself, downplayed the pandemic’s seriousness and often proposed untested treatments and cures; some claimed that the virus would go away on its own, with no governmental action needed. Once effective vaccines became available, the administration faced significant logistical challenges in producing sufficient quantities and getting them distributed across the nation. In addition, a strongly committed anti-vax minority persistently raised concerns about the vaccines’ safety. Ultimately, the electorate’s lack of confidence in the Trump administration’s ability to manage the pandemic compared to what they expected of Joe Biden became a major reason for Biden’s victory in the November 2020 election.

As the United States worked furiously to get the vaccine to more people in a relatively organized way, the country began the process of reopening, but pandemic concerns continued. New variants of the virus, often unclear guidelines, and different policies adopted by state and local
governments all made effective action difficult; to some extent, these conditions continued into the fall of 2022. The lack of a coherent and consistent policy followed by all critical actors likely worsened the public health challenge. This inconsistency was made worse by the multiple layers of government involved, the many different agencies with a role to play, and highly varied and sometimes conflicting public policy decisions they made. State and local governments often set conflicting standards. Multiple government agencies needed to coordinate efforts and determine areas of responsibility. Even the U.S. cultural tradition of freedom and self-determination (discussed in Chapter 1) was a factor as individuals and businesses made their own choices regarding the extent to which they would follow policies geared toward lessening or eliminating COVID’s threat.

This COVID response illustrates well the continued conflict between the branches of government, multiple agencies with different levels of responsibility, and the many differences in political culture and action we find at the state level. It also testifies to the general challenges of policymaking in the United States today, particularly when the proposed policies are hotly contested and when both the parties and citizens are deeply divided over the most appropriate action to take. Democrats and Republicans are often at odds over how best to deal with the nation’s policies, whether they are health care issues, economic and tax policies, or even something related to government operations such as the nomination and approval of court justices. Sometimes the outcome is policy gridlock or stalemate. Nothing can be done because neither side is willing to compromise in the bitter disputes over job creation measures, health care reform, and changes in federal entitlement programs such as Social Security and Medicare. As noted in Chapter 1, one result has been record-low levels of approval for governmental institutions and policymakers. The public understandably finds such policy stalemate in the face of serious national problems to be unacceptable (Persily 2015; Thurber and Yoshinaka 2015). Polls show a public that seeks resolution of the nation’s problems and cooperation between the parties, yet elected officials often are unable to reach any agreement in part because the core constituencies within each party adamantly hold firm. Such stalemate also reminds us that the constitutional structure of the U.S. government does not make policymaking easy, as it requires agreement between Congress and the White House and often the approval of the federal courts.

Most people see policy gridlock over health care reform, immigration, and extending or ending various tax cuts and subsidies as a failure of government, and in many ways, it is. But it is also true that U.S. political institutions were designed with the clear intention of making actions on public policy—and therefore the expansion of government authority—difficult. The chosen institutional structure reflected the prevailing political values and culture of late-eighteenth century America. At that time, only about 4 million people lived in the United States, most of them in rural areas and small towns. By 2023, the population was over 335 million, with the overwhelming majority of people living in large metropolitan areas and their suburbs. At its founding, the nation faced relatively few public problems, and most people believed that it was more important to keep their freedoms than to create a powerful government that could act swiftly in response to national problems. Many critics of the U.S. system wonder whether its political institutions are even capable of responding effectively to the complex and interdependent problems the United States faces at home and abroad today, from supporting a strong
economy to dealing with climate change or global terrorism (Chubb and Peterson 1989; Ophuls and Boyan 1992).

Understanding this system of government and how policy actors maneuver within it is essential for students of public policy. It enables us to assess the constraints on policy development and the many opportunities that nevertheless exist within the U.S. political system for solving public problems through creative policy action. The complexity of many contemporary problems, such as urban sprawl, failing public school systems, or weaknesses in the nation’s health care system, also hints at the crucial role that policy analysis plays, or can play, in designing effective, economically feasible, and fair solutions. The next chapter rounds out this introductory section of the text by offering a thorough description and analysis of the policymaking process, with special attention paid to different theories used to explain why this process produces the results that it does and the opportunities the process offers for public involvement and the use of policy analysis to clarify key issues.

GROWTH OF GOVERNMENT

Most people recognize that government today is much larger than it was at the nation’s founding and that it is much more likely to affect their lives, from regulation of broadcast media to provision of loans for college education. They may disagree, however, as liberals and conservatives often do, on whether such government involvement is a good thing or not. Most people value the services that government provides, but many also complain about government and the programs it creates, particularly their costs and effectiveness, and these complaints have grown louder in the past few years. Actions taken by the Obama administration and Congress, such as steps to revitalize the economy and dealing with the nation’s health care needs, as well as a number of policies passed during the Trump and Biden administrations as a result of the COVID-19 pandemic, increased the size of government—or at least the government’s presence—even more. So how did government come to be so big and, at least in some views, such an intrusive force in the lives of citizens?

The original U.S. government was quite small, as was the nation itself. The first Congress, representing thirteen states, had sixty-five representatives and twenty-six senators. The bureaucracy consisted of three cabinet-level departments (War, Treasury, and Foreign Affairs, to which one more, Justice, was added). In contrast, today there are fifteen departments, numerous bureaus and agencies, and a bit over 2 million civilian federal employees, excluding postal workers. Despite widespread belief to the contrary, the federal government’s size, measured by employees and not budgets, has been relatively stable since the 1970s. Indeed, it decreased during the 1990s and has seen only a slight increase since 2000. However, at the same time the number of federal contractors and grant recipients has increased substantially since 1990 and particularly since the early 2000s. As Brookings Institution scholar Paul Light has argued, this group constitutes a kind of “hidden” federal workforce and disguises the true size of government today. Much of the rest of the recent growth in number of government employees has been in the states. However, growth in government employment at the state level declined appreciably as states trimmed their budgets due to concerns about spending too
much. Still, viewed in the broad sweep of history, it is important to understand why government has grown to its present size.

Obviously, part of the growth of government results from the expansion of the United States in physical area and population. As noted, the population has increased dramatically from the initial 4 million residents at the time of the first census in 1790. The population today is also heavily urban and well educated compared to that of 1790, and it occupies land from coast to coast as well as in Alaska and Hawaii. Demographics and geography, however, cannot fully explain the growth of government, which has more to do with the changing nature of public problems and citizen expectations for government services than it does with the nation’s size.

One major reason for government’s increasing size is that American society has become more complex and faces more challenging problems. This added complexity, which comes in part from advances in science, technology, and business operations, has led to many kinds of government intervention, from regulation of television, radio, and satellite communications to airline and automobile safety; none was a reason for concern a hundred years ago.

Another reason for the growth of government is the public’s acceptance of business regulation. Even though politicians still like to talk about the free-market economy, the United States has moved away from it to a regulated, or mixed, economy. Nowhere does the Constitution mention the power to prevent monopolies, provide for safe food and drugs, assure consumers of product safety, protect air and water quality, or require limits on child labor, but all these policies are in effect, to varying degrees, today. They resulted not only from legislation but also from the Supreme Court’s expansive interpretations of commerce and the necessary and proper clauses of the Constitution.

Viewed from a historical perspective, policy change on government regulation has been astonishing. Congress has enacted regulatory statutes that, prior to the Progressive Era of the late nineteenth and early twentieth centuries, many would have considered improper exercises of government authority. By then, however, social pressure for reform was strong enough that policymakers had the backing to correct some of the excesses flowing from rapid industrialization in the 1800s. These included the prevalence of unsafe food and drugs and dangerous working conditions, as well as the domination of entire industries by monopolies. These social pressures also spurred major advances in business regulation during President Franklin Roosevelt’s New Deal (Harris and Milkis 1996). At first resistant to New Deal legislation, the Supreme Court eventually ruled many of these acts constitutional. In doing so, the court reflected society’s endorsement of these new powers of government.

Attitudes have also changed about government’s role in social welfare. Again, under the New Deal, the federal government signaled its responsibility to provide a minimal level of support for certain individuals, including the poor, farmers, and the elderly. By that time, many states had already developed such social programs for certain categories of individuals (Skocpol 1995). President Lyndon Johnson’s Great Society agenda expanded those commitments in the 1960s. As government moved into the area of social welfare support, it also grew to administer these programs. For example, Social Security today is the single-biggest government program and requires a large organization to administer it. The Affordable Care Act, adopted in 2010, also represented an increase in the government’s role related to social welfare.
America’s role in the world has also contributed to government growth. After World War II (1941–1945), the United States emerged as a superpower and took a far larger role in world affairs. The government had to grow to keep up with the new responsibilities in foreign affairs and national defense. This has meant an increase in the budget and personnel not only of the Departments of Defense and State but also of agencies with peripheral connections to international affairs, such as the Environmental Protection Agency (EPA) and the Departments of Commerce and Agriculture.

In addition, the size, scope, and cost of certain projects mean that only the government can undertake them. They may come about because of a market failure, as discussed in Chapter 1, or changes in public expectations of government. Some individuals and organized groups therefore argue that for social or economic progress to occur government needs to become involved. No other entity, they say, can perform the functions of government, especially space exploration and other scientific research and development, including work in the areas of defense, energy, and health. An interest in returning to the moon, for example, and eventually Mars, requires government to take on a significant role even as private companies, such as SpaceX and Blue Origin, develop their own space exploration plans.

Finally, Americans must accept some responsibility for the growth of government. Citizen demands for government action continue to rise. Americans tend to be ideologically conservative but liberal in practice with respect to provision of government services, from police protection to health care for the elderly. The rise of conservative movement in recent years is partially in response to what its supporters see as a federal government that is overinvolved. One can see the evidence of an expanding role for government throughout the federal rulemaking process, which is a good indicator of the government’s growth:

The American people have long decried government in the abstract but rushed to its waiting arms with their problems or dreams. Throughout the 1980s, the 1990s, and into the 2000s, when skepticism and outright hostility toward the federal government reached unprecedented levels, demands for specific public responses to private needs and desires continued unabated. (Kerwin and Furlong 2019, 83)

The Tenth Amendment to the Constitution declares, “The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.” These powers, called the reserve powers of the states, are the basis for their right to legislate in many areas. Despite the federal government’s involvement in public policy issues that were formerly the states’ exclusive domain, state and local governments also have grown substantially over the past fifty years. Moreover, the trend toward devolution to the states (discussed later) has meant that many of these governments now are often at the leading edge of policy development.

The effects of government growth are many. First, government policies affect most of what people do every day. Second, government growth has led to an entire occupational sector. Not only are governments at all levels major employers, but also their buying power has a substantial impact on numerous economic sectors that rely on government programs and spending. Third, the scope of government increases the likelihood of conflicting public policies and greater
difficulty in addressing society’s problems. Fourth, policymaking in a large, complex government organization takes more time and effort—to analyze problems, discuss alternatives, decide on solutions, and implement programs—than in a smaller entity. When such efforts fail, the result is policy stalemate or gridlock, the phenomenon to which we referred at the chapter’s opening. This is a major reason we emphasize in this chapter how the government’s policy capacity—its ability to identify, assess, and respond to public problems—might be improved.

GOVERNMENT INSTITUTIONS AND POLICY CAPACITY

Many students are already familiar with the major U.S. government institutions. Even so, a brief review of their most notable features and the implications for public policymaking may be useful. The reason is that the way institutions are designed and structured is critical to how they function, as are the rules they adopt for decision-making. Both affect their policy capacity.

The nation’s founders created a system of checks and balances among the institutions of government, primarily to ensure that government could not tyrannize the population—that is, power would not be concentrated enough to pose such a threat. The formal structure of government they established well over 200 years ago remains much the same today. The U.S. system is based on a tripartite division of authority among legislative, executive, and judicial institutions and a federal system in which the national government and the states have both separate and overlapping authority. Each branch of the federal government has distinct responsibilities under the Constitution but also shares authority with the other two. This system of separated institutions sharing power had the noble intention of limiting government authority over citizens and protecting their liberty, but the fragmentation of government power also has a significant impact on policymaking processes and the policies that result.

Fragmented power does not prevent policy action, as the routine administration of current national policies and programs and the development of new policies clearly show. Moreover, when conditions are right, U.S. policymaking institutions can act, sometimes quickly, to approve major policy advances. Often, they do so with broad bipartisan support (Jones 1999; Mayhew 1991). Some examples include the enactments of the USA PATRIOT Act in 2001, the Emergency Economic Stabilization Act in 2008, and the Every Student Succeeds Act in 2015. What conditions lead to such substantial policy changes in a system that generally poses significant barriers to such action? It is an intriguing question to ponder and one that this chapter explores.

Despite policy successes, the fragmented U.S. political system generally makes it difficult for policymakers to respond to most public problems in a prompt and coherent manner. The same can be said about the constitutional mandate for a federal system in which the states share power with the national government. The fifty states and about 80,000 local governments chart their own policy courses within the limits set by the Constitution and national law. Stalemate at the national level usually increases during periods of divided government, when one political party controls the presidency and the other at least one house of Congress (Ripley and Franklin 1991; Thurber 1991; Thurber and Yoshinaka 2015). The reasons are clear: members of the same political party tend to have similar beliefs concerning the scope
of government and the direction of policies, but the two major parties often hold strongly conflicting views on these matters.

Although divided government makes agreement and cooperation difficult, policymaking can continue even under these circumstances. In fact, David Mayhew (1991) argues that divided government has historically had only a limited impact on the enactment of major public policies at the national level. A good illustration is one of the most expansive laws ever written, the Clean Air Act Amendments of 1990, approved in a period of split-party control of the White House and Congress. Yet as the polarization and acrimony between the parties continues, one must wonder whether it becomes so difficult to find common ground for policymakers, particularly during times of divided government, that any significant action is possible.

The election of Donald Trump, and then Joe Biden, as president ushered in other periods of unified government, first for the Republicans and then for the Democrats. While there were some legislative successes during the first two years of the Trump administration, including an exceptionally large tax cut, the pursuit of many other goals, such as repealing Obamacare, was unsuccessful. In fact, beyond the tax bill, there were few major legislative successes during the Trump administration despite Republican control of the House, Senate, and the presidency. Democrats retook the House following a strong showing in the 2018 midterm elections, and the Senate and presidency in 2020. President Biden's first two years saw significant legislative accomplishments, including passage of a long-delayed major infrastructure package, the American Rescue Plan (to help revive the economy after COVID-19), and the Inflation Reduction Act. The last subsidized the development of clean energy concerns, took other actions on climate change, and addressed the high price of prescription drugs, especially for those enrolled in Medicare. The 2022 midterm election kept the Senate in Democratic hands, but gave Republicans the House by a narrow margin, thus bringing divided government once more and limited potential for new legislative action.

While this account makes it appear that there is a lot of variability in congressional elections, the truth is that very few House seats are considered competitive in any given election. State legislatures set congressional district boundaries every ten years following a new national census, and in most states, they do so in a way to protect the party in power. As a result, many see this process as broken. According to some political analysts, such partisan decision-making has resulted in congressional districts that produce more extreme or fringe candidates who believe they can safely ignore dissenting voices within their districts, particularly from the opposing party. This has led to some successful legal challenges to the existing district lines and judicial decisions requiring that these lines be redrawn, in addition to other cases where the courts have accepted the states’ redistricting decisions. In some states, the drawing of district lines also has affected control of the state legislature and congressional delegations—that is, where control in effect goes to the party that won a minority of the overall votes cast. This was seen, for example, in the 2018 election results in Wisconsin where the Democrats won 54 percent of the popular vote cast for the state assembly but took only 36 percent of the seats. For these reasons, some states, most notably Iowa and California, have turned to a nonpartisan process for redistricting.
Fragmented power can lead to other concerns. For example, states’ policies, such as California’s stringent air quality laws and Massachusetts’s universal health care plan, sometimes result in significant advantages for their citizens that people living in other states do not enjoy. In addition, serious conflicts can develop between the federal government and the states. In the 1950s and 1960s, the federal government enacted legislation banning segregation in response to state Jim Crow laws that denied African Americans equal rights. But even passage of the federal Civil Rights Act of 1964, which ended legally sanctioned discrimination, did not resolve all the conflicts (Williams 1987). A number of southern states refused to implement the federal statutes, resulting in continued civil rights abuses in those states.

The ways government institutions are structured and how they make decisions are not immutable. They can be changed, and occasionally they are, as citizens and policymakers look to improve government performance or try novel approaches to decision-making. In fact, most of the time policymaking involves action that falls between gridlock and innovation. The norm in U.S. politics is incremental policymaking, especially for noncontroversial policies. Incremental policy changes are small steps, often taken slowly. They are adjustments made at the margins of existing policies through minor amendments or the gradual extension of a program’s mandate or the groups it serves. The Head Start preschool program is a good example of incremental change, made possible because it is seen as a success.

Presidents can play a role in pushing for change, and they sometimes favor dramatic shifts in policies or the structures of government. President Johnson pushed strongly in the early to mid-1960s for enactment of the new civil rights policies discussed earlier as well as the War on Poverty. In response to the September 11, 2001, attacks on the United States, President George W. Bush proposed creation of a new and large cabinet department, the Department of Homeland Security, to help prevent future terrorist attacks. And as noted, President Obama was instrumental in passing health care reform, which represented a major shift in policy in this arena.

Figure 2.1 provides an overview of the U.S. political system, with a focus on its initiative-taking elements—Congress, the president, and the rest of the executive branch. State governments are organized in a comparable manner. The figure illustrates the different institutions and policy actors who play a role in public policy development and implementation. One can read this figure in two somewhat separate ways. First, it serves as a reminder that the U.S. system imposes substantial barriers to a top-down, unilateral approach to making public policy. Second, it shows the many different points of access the system affords to policy advocates. State and local governments dominate in many policy areas, such as education and crime control. They also sometimes intervene when the federal government chooses not to act. For example, faced with federal inaction, many states have adopted climate change policies that try to reduce use of fossil fuels (Rabe 2004, 2018, 2025).

The next section discusses the major features of the U.S. government system, beginning with federalism and followed by the institutions of the federal government. The chapter continues with “informal” policy actors, those outside of government who shape public policy, including the general public and organized interest groups. The purpose of this review is twofold: first, to reacquaint readers with the basic components of government, and second, to encourage them to think about the choices that are represented in these arrangements. Why is government structured one way and not another? What difference does the structure of government
make for public policymaking and the substance of public policy? What changes in government might be desirable in terms of improving performance, especially the effectiveness, efficiency, and equity of policies? Or in improving the responsiveness of government to the U.S. public?

**FEDERALISM**

As noted earlier, the framers of the U.S. Constitution designed a system of government that divides power between the national government and the states (and, for some purposes, Native American tribes). Both the national and state governments have the authority to enact laws...
or public policies. We focus here on the history of federalism, the federal–state relationship, the continuing controversies over the proper allocation of responsibility between the federal government and the states, and the variation among the states in their capacity for public policy innovation.

**The Evolution of Federal–State Relations**

During the early history of the United States, disputes arose over how much power the national government should have compared to the states. As the national government attempted to assert itself on issues such as the establishment of a national bank and the rules of interstate commerce, its authority was challenged. The Supreme Court, led by Chief Justice John Marshall, supported an expanded role of the national government. Yet as disagreement over the spread of slavery to new states and the subsequent Civil War showed, major conflicts persisted over interpretation of the national government’s powers.

The relationship between national and state governments in policymaking has evolved since the nation’s founding. In the late eighteenth century, the functions or responsibilities of each level of government were quite distinct. State governments, for example, were responsible for education and transportation policies. The national government limited itself to larger issues such as national defense and international trade. Little integration of the two levels of government existed. This state of affairs is often referred to as dual federalism, and it persisted throughout the nineteenth century, in part because the federal government’s activities remained limited.

In the twentieth century, federal–state relations changed significantly, especially in response to the Great Depression of the 1930s. President Roosevelt’s legislative program, known as the New Deal, was an expansive economic recovery program that began to break down the imaginary barriers between national and state policy. It was not unusual to see the national government become involved in what were traditionally considered state responsibilities. Thus dual federalism over time evolved into cooperative federalism, as collaboration on policymaking between the national and state governments increased. Many large-scale federal programs that began in the 1960s and 1970s, another period of government growth, relied on such a model. The federal clean air and clean water programs, for example, involved a mix of national and state responsibilities, with the national government setting environmental protection standards and the states carrying out most implementation actions.

Much of the cooperation that occurred between the national and state governments was a result of the federal government supplying additional monies to the states through block grants and categorical grants. Block grants are transfers of federal dollars to the states where the states have substantial discretion in how to spend the money to meet the needs of their citizens. Categorical grants also involve the transfer of federal dollars to the states, but in this case, states must use the funding for specific purposes. During the 1970s and 1980s, critics of increasing federal power urged the states to retake some of their policymaking responsibilities. President Richard Nixon’s “new federalism” initiatives in the early 1970s were designed to move away from categorical grants and toward block grants to give the states more discretion in how they used the funds. The devolution of policy to the states continued under President Ronald
Reagan. His conservative philosophy and political rhetoric gave a significant boost to the trend already underway to restore greater authority to the states. Although many states welcomed this change, they also worried about the subsequent decrease in federal dollars coming into their treasuries.

In addition, the national government had discovered a new way to enact popular policies without paying for them: it gave implementation responsibilities to the states. Federal policymakers received political credit for the new programs without spending federal tax dollars. These *unfunded mandates*—federal requirements placed on the state governments without funds for implementation—added stress to the relationship between the national and state governments. That relationship continues to evolve. In 1995, Congress enacted the Unfunded Mandates Reform Act to limit future financial impacts on the states, but conflict over policymaking in a federal system did not vanish as a result. Congress continued to approve mandates with insufficient funding, at least according to state policymakers. The No Child Left Behind program is one example. Debate focused on the impact on the states of mandatory national standards for promoting primary and secondary school students to the next grade. Supporters of the standards wanted to ensure that students had the skills and knowledge to compete nationally and internationally. Few questioned the goal of improving the quality of the nation’s schools, but many had doubts about imposing federal standards in a policy area that has traditionally been a state responsibility.

**State Variation in Policy Capacity**

As some policy authority moved back to the states, questions arose regarding whether the states have the capacity to handle additional responsibilities. The issues that arise in this debate parallel the book’s main evaluative criteria. For example, critics of *decentralization* are concerned about the implications for program effectiveness, efficiency, and equity because they recognize that the fifty states are quite different from one another both in their capacity to act on policy issues and in the kinds of policies they enact.

The states also differ in fundamental ways such as physical size, population, extent of industrialization, and affluence. Moreover, each state and region has a distinctive history and culture that shape policy actions (Elazar 1984; Lieske 1993). What may work well and be acceptable to residents of Wisconsin or Minnesota might not be appropriate or feasible in Texas or Mississippi. Some states have extensive state parks and other recreational facilities, while others do not. Some have strict vehicle inspection programs to promote highway safety, and other states have no such programs. We have already noted California’s recent decision to not sell new gasoline-powered vehicles starting in 2035—a decision that may lead other states to make similar decisions. There is nothing inherently negative about such policy variation among the states; indeed, throughout the nation’s history, Americans have celebrated the rich diversity of state cultures and policy preferences. However, when a state’s policies are so different from others that its residents may be deprived of essential human needs or federally protected rights, the federal government is likely to intervene. One might argue that this was the justification for No Child Left Behind: to ensure certain minimal expectations for students regardless of where they get their education. Similarly, many applauded a decision by the Food
and Drug Administration (FDA) in November 2013 proposing a general ban on trans fats in food to protect public health.

Brookings scholar Darrell M. West argues that in recent times states have been “entering a new phase that pits blue states against red ones and blue cities against red cities . . . [and that] some leaders are seeking to impose their own policy views on other places.” As polarization has increased, the experimentation encouraged by federalism can lead to more extreme policies and actions, which in turn can create regional conflicts. West provides examples of different policies on abortion services, the shipping of immigrants from the south to the north, and gun control policies.

Those who favor increasing state authority tend to believe that the states are capable of handling additional responsibilities and are better equipped than the federal government at defining their citizens’ needs. Indeed, for some, the states are the “new heroes” of American federalism, with greater capacity for policy innovation and closer ties to citizens than a national government in which many have lost their faith. Studies show that over the past several decades state legislatures and bureaucracies have become more skilled than they were before at dealing with policy issues (Hedge 1998). Their new capacity comes from growth in their professional staffs and expertise, including the ability to appraise policy needs and evaluate programs with greater accuracy.
Depending on its economic conditions, a state could also act on public problems because it may have sufficient funds to do so, from transfer of federal dollars and state taxation (A. Bowman and Kearney 2022). The best evidence supporting these arguments can be found in the many innovative and effective measures states have taken over the past several decades in various areas (Borins 1998; Rabe 2022; Teske 2004). For example, state and local governments are responsible for highway safety, and states have been at the forefront in requiring seat belts and adopting speed limit laws. The box Working with Sources: State Public Policies indicates where readers can locate information about variation among the states in public policy.

Nevertheless, analysts have several reasons to remain skeptical of how much more decentralization of federal power to the states is desirable:

- Policy performance varies from state to state, and citizens may suffer the consequences. For example, some states fail to fully test drinking water or to enforce clean air laws, even though they are violating federal environmental laws (Rabe 2022). An example of this is what occurred beginning in 2014 in Flint, Michigan, where the local government failed to test the city’s drinking water for toxic levels of lead contamination.

- States with more money and greater expertise than others can design better programs and offer more services to their citizens.

- Business and industry interest groups may exert more influence at the state than at the national level because of the states’ eagerness to attract businesses and jobs. One example is the theme park industry in Florida.

- Decisions may be less open and less visible at the state level, despite the closer proximity of government to citizens.

- Many public problems, such as air and water pollution, cross state boundaries, suggesting that a higher level of government is needed to address them adequately.

- Only the federal government has sufficient resources to support policy activities such as scientific research for environmental protection and health care.

**WORKING WITH SOURCES**

**STATE PUBLIC POLICIES**

One way to become familiar with public policy variation among the fifty states is to explore what they have done in a particular policy area, such as education, health care, environmental protection, economic development, or criminal justice. The website for the National Conference of State Legislatures (NCSL; www.ncsl.org) is a good place to go to see what differences there may be between states on a variety of issues. The NCSL site has extensive news reports on policy activities that affect the states, including policy innovation.
Reading about different policy actions within the states is one of the best ways to inform yourself about state capacity for policy development and to see how the states differ from one another in this regard.

Visit the NCSL web page; click on Research and select Immigration, then State Immigration Laws, and then the most recent report. The site also provides a variety of information regarding immigration and related policies. Here, you can learn more about what states are doing around the issue of immigration. Note what states have adopted or considered policies about sanctuary or refugees, among other areas.

You can also do a Google search on how the federal government is addressing the issues related to immigration. Now that you have explored this policy from different states’ perspectives, think about these questions:

- What states appear to be more accepting of immigration? Are there certain characteristics about these states that are similar and may explain their willingness to be more open to immigration?
- How does the federal government address this issue? What role does the federal government have in this area, if any?
- Why are certain decisions left to the states and others shared or left to the federal government?

It seems likely that public debate over the proper distribution of authority between the states and the federal government will continue. The question at the heart of the controversy is which level of government is best suited to address various kinds of public policies. That question has no automatic answer, however, and each person’s position is likely to be influenced by their beliefs about the role of government in society, particularly the national government. As public policy students become acquainted with evaluative criteria and how they apply to public policy questions, the appropriate level of government to address them may become apparent.

**SEPARATION OF POWERS**

One of the distinguishing characteristics of the U.S. Constitution is the separation of powers. The three branches of government (legislative, executive, and judicial) share governing power. The Founding Fathers feared that unrestrained government authority could abuse citizens’ rights, and they believed that the checks and balances built into a system of separated powers would ensure that no one branch of government would have enough power to threaten liberty. In fact, under this system the legislative and executive branches must cooperate to accomplish almost anything, and this is not always easy to achieve (Jones 1999). Most people would agree that the goal of preventing tyranny is a worthy one, but the separation of powers has added to the complexity and difficulty of policymaking and to policy gridlock.

The number and diversity of policy actors within the U.S. government and their overlapping responsibilities contribute to the complexity, making it difficult to figure out who is responsible for any particular government action. Consider the recent debates surrounding immigration policy. Proposals vary widely both between the branches of government and even within the political parties. President Trump and many Republicans favored the building of a southern
border wall and stringent policies in regards to deportation of those residing in the nation illegally. They also took a tough stance on conditions for seeking political asylum in the nation and sought to limit legal immigration as well. In contrast, Democrats and others have favored a pathway to citizenship for at least some of those who have long resided in the country without documentation and a more generous set of requirements for those seeking legal immigration or political asylum. Varying responses to these challenges of immigration policy illustrate well the continuing concerns of policy gridlock and the constant struggle for power between the executive and legislative branches of government.\footnote{14}

Other policy conflicts illustrate different approaches taken by the federal government and the states. Climate change, by its very nature a national and global problem, has been addressed more systematically by the states rather than the national government. Some twenty-nine states have adopted renewable energy portfolios to require use of non-fossil fuel energy sources while others have formed regional partnerships to reduce emissions of greenhouse gases (Rabe 2022). The federal government, however, has found it difficult to act on climate change, particularly in the U.S. Congress, as the two major parties have adopted sharply conflicting views on the severity of the problem and acceptable solutions. The Trump administration pulled the United States from the Paris Agreement on climate change and attempted to reverse most of the Obama administration’s rules and regulations to reduce greenhouse gas emissions (discussed in Chapter 11). However, in 2022, prodded by the Biden administration, Democrats in Congress narrowly approved major climate change legislation, albeit it along partisan lines.

Difficulty in policymaking is a reflection of the government’s capacity to respond to public problems in light of divided institutions and authority and the political conflicts that inevitably arise over how best to deal with those challenges. In other words, it is not easy to identify and define problems, develop suitable solutions, and approve the solutions in such a fragmented governing system. The following sections explore the branches of the national government, each branch’s major characteristics, and the implications of these characteristics for policymaking. In general, all state governments have similar systems and must deal with comparable complexity and difficulty within their own policy processes.

**Legislative Branch**

The legislative branch of the United States is a **bicameral** (two-house) Congress, consisting of the House of Representatives and the Senate. The two chambers differ from each other in both their composition and operating style. The House, with members elected every two years from separate districts within each state, is the more representative or democratic chamber of the two. It has 435 voting members, each representing about 765,000 constituents.\footnote{15} Senators, of whom there are 100, serve six-year terms, giving them more independence than House members since they need not face voters as frequently. Moreover, with only one-third of its members up for reelection every two years, the Senate is also more insulated than the House from short-term political forces.

Each state, regardless of its size, elects two senators so that the 100 members serve quite different constituencies. California’s senators, for example, represent about 40 million people, while the senators from Wyoming represent fewer than 600,000. The District of Columbia,
with a population of about 700,000, has no representation at all in the Senate because it is not a state, even though its population exceeds that of Wyoming and Vermont. The Senate also allows its members more freedom to debate issues than does the House. Senators have the right to filibuster, or to talk for an extended period of time in hope of delaying, modifying, or defeating a proposal. Threats of a filibuster can force policy compromises as members try to prevent having all other business grind to a halt. The box Working with Sources: Congress gives you the opportunity to see how the bicameral legislature often leads to different bills on the same general area and explore why this may be the case.

Article I of the Constitution spells out Congress’s powers, but the most important today are its lawmaking and budgetary responsibilities. In addition to passing legislation, Congress each year must appropriate the funds necessary to run government programs. To accomplish these tasks, both chambers operate under a system that allows for division of labor and policy specialization. Policy development is concentrated within this elaborate system of committees and subcommittees, each one chaired by the party holding a majority of seats in Congress.

Each of the over 200 committees and subcommittees has specific jurisdiction over certain public policies and the executive agencies that administer them. Each has a substantial staff that can bring experience and expertise to bear on lawmaking and on oversight and investigations of the executive agencies. Bills introduced into either chamber are referred to a committee for consideration. If the committee chooses to move ahead on the legislation, it typically conducts public hearings to acquire information on the advantages and disadvantages of the proposed law. Executive branch officials and experts from academia, think tanks, and interest groups may be invited to Capitol Hill to testify. It is easy to find verbatim accounts of testimony through services available at most college libraries, such as the LexisNexis congressional database. Eventually, the committees accept, modify, or reject the legislation. For bills that are to move forward, the committees submit reports on their findings and recommendations to the full chamber for consideration. To become law, a bill must pass both chambers in identical form and be signed by the president. Presidents may veto, or reject, a bill approved by Congress, and Congress in turn may override the president’s veto with a two-thirds vote in both houses. Normally, Congress has a tough time overriding a presidential veto.

WORKING WITH SOURCES

CONGRESS

As stated in the chapter, policy gridlock sometimes occurs because of differences within our bicameral Congress. Members of the two houses, the Senate and House of Representatives, may differ significantly in how they view policy proposals even when the same party controls both. To illustrate this, go to Congress.gov where you can access a wide range of information on Congress. On the site, you will see a section titled Most-Viewed Bills. Click on one of the bills listed. From this point, you can get a variety of information about the bill, including the full text, a summary, committee assignment, and so on. You can also see the related bills...
associated with the selected bill. If you selected a House bill (designated with the letter H), select a related Senate (designated with an S) bill. Compare the two versions.

- What is the issue or problem that these bills address?
- What are some of the differences between the versions you are examining? What about similarities?
- Why do you think there are such discrepancies in these two versions? What is it about the two legislative bodies that may lead to such divergence?

The fragmentation of authority among the committees in Congress can pose an obstacle to policymaking, but there is an upside as well. The substantial number of committees and subcommittees creates multiple venues for highlighting public problems and considering policy proposals. In this way, almost any issue, from energy conservation to child care, can gain attention on Capitol Hill and possibly by the media as well.

Often, the committees, or the full House and Senate, fail to agree on policy proposals, and policy gridlock results. It is tempting to fault members of Congress for inaction, but the causes of policy disagreement and stalemate are easy to understand. The parties are deeply divided ideologically, and on key issues—from immigration policy to health care policy—members are lobbied intensely by organized interest groups as well as by political activists within their parties. Moreover, when Congress is divided on public policy, the nation often is as well. As a representative political institution, Congress reflects the larger society, for better or worse. In a sense, Congress struggles continuously with its dual roles of representation and lawmaking (Davidson et al. 2022).

This tension is evident in the policy behavior of members of Congress. Incumbent members usually seek reelection and are overwhelmingly successful in retaining their seats. As David Mayhew (1974) has argued, because of their electoral incentive members are strongly motivated to stay in the spotlight; take positions on the issues, even if they do nothing about them; and claim credit for public policy actions, particularly those that materially benefit the districts or states. These pressures mean that members often introduce bills, make speeches, and distribute press releases on many issues, even when the legislation has no chance of moving forward. In many ways, Congress is a loosely connected assembly of 535 elected officials who, because of the electoral incentive, often go their own way. If they do not function as teammates, policy action that requires agreement may be stymied.

To rein in this natural tendency toward political individualism, Congress relies on the elected leadership within each house, which is organized by political parties. The majority party dominates the House and Senate agendas and decision-making processes to a substantial degree. Historically, the party leadership has been instrumental in overcoming ideological and regional divisions within Congress and forging consensus; it also negotiates with the president on potentially divisive policy issues (Jones 1999; Sinclair 2012). As parties have weakened and members have relied less on the support of their parties, however, the leadership role is less evident. There are numerous recent examples of the House and Senate leaders having a tough time getting their rank and file to follow their lead. In addition, individual members of Congress rely on their substantial
personal staffs to develop policy. Policy formulation of this kind is particularly likely in the Senate, where senators have larger staffs and attract greater media coverage than do House members.

In recent years, both the House and the Senate have been closely divided in party membership, which may force the two major parties to work together to fashion legislative compromises. Party control of each chamber remains highly important and seen by the jockeying by the two parties as they attempt to capture the Senate and the House. After the 2020 election, the Senate was evenly divided at 50 Republicans and 50 Democrats, with Vice President Harris’s tie-breaking vote effectively giving Democrats the majority. After the 2022 midterm election, Democrats maintained control of the Senate by a margin of 51 to the Republicans’ 49; three Independents in the Senate caucus with or generally vote with the Democrats. The House of Representatives’ distribution flipped in 2018 and saw the Democrats capture the House and then hold it following the 2020 election. The 2022 midterm election gave Republicans the House by a much more narrow margin than had been the case in recent years. The new House that began in January 2023 had 222 Republicans and 213 Democrats.

**Executive Branch**

The federal executive branch is responsible for carrying out the laws enacted by Congress. It consists of the president, the vice president, the White House staff, and the federal bureaucracy. Although presidents do not make laws, they are actively involved in agenda setting, policy formulation and adoption, and implementation (J. Anderson 2023; Jones 1999). Other than the vice president, the president is the only federal official elected nationally. In effect, the president embodies the U.S. government, symbolizes U.S. culture and values, and speaks for the nation abroad. As such, he commands enormous public and media attention that gives him unequaled influence in agenda setting and policy leadership. Barack Obama used his position as president to persuade Congress to approve major health care reform legislation. Donald Trump used his presidency to try to forge new government positions on immigration and to challenge many long-standing U.S. positions on foreign policy. President Biden, with very narrow majorities in the House and Senate, nonetheless enjoyed significant legislative achievements in 2021 and 2022.

In addition to the president, the entire White House staff and the **Executive Office of the President (EOP)** are intimately involved in policy development. The EOP consists of the White House offices and agencies that assist the president in the development and implementation of public policy. Among other offices, these include the Office of Management and Budget, the Council of Economic Advisers, the National Security Council, the Council on Environmental Quality, and the Office of Science and Technology Policy. Together, these offices constitute a “mini-bureaucracy” that provides the president and his staff with vital information and policy ideas in their respective areas. The EOP keeps the president informed about the plethora of policies Congress is considering or the federal bureaucracy is implementing, giving him opportunities to influence policy direction.

In most policy areas, the president’s agenda and his positions, particularly on domestic issues, reflect his party affiliation and political ideology, as well as the constellation of constituencies most important to his party and—if he is in his first term—his reelection. Democratic and Republican presidents tend to adopt distinctive policy positions on most issues because
of their differing philosophies of governance and the particular array of interests the parties represent. The federal bureaucracy constitutes the bulk of the executive branch. It includes all the agencies and offices that fall under each of the cabinet departments and other offices and agencies whose mission is to develop and implement policy in specialized areas. The best known of these are the fifteen cabinet-level departments, each managed by a secretary appointed by the president and confirmed by the Senate.

Each cabinet department includes subsidiary agencies, some of which better known than their home departments. For example, the Federal Aviation Administration (FAA), which has primary responsibility for aviation safety, is part of the Transportation Department; the FDA, responsible for ensuring the safety of food and medicine, is part of Health and Human Services; and the Federal Bureau of Investigation (FBI), charged with protecting and defending the United States from foreign and domestic threats, is the investigative arm of the Justice Department. The bureaucratic agencies issue reports and studies that enable the public to follow the agencies’ activities in their special policy areas, much of which can be found on agency websites (see the box Working with Sources: Executive Departments and Agencies).

### WORKING WITH SOURCES

**EXECUTIVE DEPARTMENTS AND AGENCIES**

While often unknown by the general public, most public policy in the United States is actually made through various processes within government agencies. Environmental regulations to ensure clean drinking water, safety standards for various products, and crash standards for automobiles are all made within the federal government bureaucracy. You can get a sense of how agencies act on such problems by exploring their websites. Go to one of these sites by either typing its direct address or, if unknown, starting at USA.gov and selecting Government Agencies and Elected Officials, then A–Z Index of Government Agencies. From here, you can find any government agency. Agency sites differ quite a lot, so spend some time exploring your selection. Find a link that discusses policies, laws, regulations, or something similar and then explore some of the issue areas in which the agency makes policy.

Consider the following questions:

- What is the main purpose of the agency (you may find something in a mission statement)?
- What policy did you select? What is its intent? What problem is it attempting to solve? How does it pursue these policies? In other words, what government tools, such as regulations and subsidies, does the agency use to meet its goals?
- Who or what group/business would be most interested in this policy? Why?

Each agency typically makes policy within its specialized area through the interpretation of legislative language and development of regulations that are essential to policy implementation. Career federal officials in the agencies have considerable authority to shape public policy, even though ultimate responsibility for policymaking rests with the president’s appointees at the top.
of each agency and department. The career officials work closely with the White House to ensure that agency and department policy decisions are consistent with the president’s programs and priorities, at least where the decisions are not strictly limited by statutory specifications. As a result, the U.S. bureaucracy is more politicized than bureaucracies in many other developed nations, and its policies can change significantly from one administration to the next.

Presidential appointees tend to support the ideological perspective of the president, so the election of a new president often causes a shift in agency appointees as well. These appointments not only affect the managerial levels of an agency but also can shape advisory committee selections. Many agencies, such as the FDA, the Centers for Disease Control and Prevention (CDC), and the EPA, use advisory committees to help inform government decisions in public health and other policy areas. Because their interpretation of scientific evidence can push policy decisions one way or another, presidents and cabinet officials take a keen interest in who serves on these committees.\(^{16}\)

Understandably, shifts in presidential ideology can affect the filling of agency positions. For example, conflicting ideological perspectives hindered the development of the Consumer Financial Protection Bureau, established by the Dodd-Frank financial regulatory act of 2010. That act was approved in the 111th Congress (2009–2011) in response to what Democrats in particular saw as weak regulation of Wall Street and financial markets, including mortgage lenders, credit reporting agencies, and payday loan businesses. One of the leaders in developing the consumer protection agency, former Harvard Law School professor and now Senator Elizabeth Warren, was passed over as the first director because Congress would not have approved of her nomination. Republicans in particular were fiercely opposed because of what they considered her antibusiness attitudes.

Outside of the cabinet departments are the numerous independent executive and regulatory agencies. One of the best known is the EPA, an independent executive agency with an appointed administrator who has major policymaking and implementation responsibilities for environmental policy. Independent agencies differ from cabinet-level departments chiefly because they are responsible for a more focused policy area. Other examples include the National Aeronautics and Space Administration (NASA); the Central Intelligence Agency (CIA); and the Nuclear Regulatory Commission (NRC), which oversees the civilian use of nuclear energy.

The independent regulatory commission (IRC) is yet another breed of executive agency. Like cabinet secretaries, the president appoints the commissioners and the Senate confirms them, but for fixed and staggered terms. These fixed terms are intended to insulate IRC decision-making from political pressure from the president or Congress. In addition, most IRCs are responsible for the economic regulation of certain industries. For example, the Federal Communications Commission (FCC) regulates the broadcasting industry, and the Securities and Exchange Commission (SEC) regulates the financial markets. An IRC focuses on one industry, and therefore its scope of authority tends to be narrow.

Although each agency operates within its own area of expertise, what it does can be in conflict with another agency. For example, the EPA, intent on its mission to reduce pollution, for years wanted automobiles to have onboard pollution controls to cut emissions coming from engines. The National Highway Traffic Safety Administration (part of the Transportation
Department, concerned with its mission of safe automobile travel, believed that such a mechanism would make cars more susceptible to explosion. Table 2.1 lists the fifteen federal cabinet departments and a selection of executive agencies.

**Judicial Branch**

The federal judiciary is made up of the nine-member Supreme Court, thirteen circuit courts of appeals, and ninety-four federal district courts, as well as special courts such as bankruptcy courts, a court of appeals for the armed services, and a court of federal claims. Although many would not think of them as policymakers, the courts play a vital role in the process by interpreting the policy decisions made by others; indeed, the courts often have the last word on policy—thus the intense political debate that occurs, particularly when filling a vacancy on the Supreme Court. The major distinction between the judiciary and the other two branches is that the courts’ policymaking is reactive rather than proactive. Unlike Congress and the executive branch, which can initiate policy, the federal courts offer rulings and opinions only on cases brought before them. Yet these rulings may dictate policy far beyond the actual cases. Consider the Supreme Court’s ruling in *Brown v. Board of Education of Topeka* (1954), which overruled the precedent of “separate but equal” public schools, thereby ending legally sanctioned segregation; or the court’s decision in *Roe v. Wade* (1973), which struck down state laws that made abortion a crime. Contrarily, in 2022 in the *Dobbs v. Jackson Women’s Health Organization* case, the court overturned *Roe v. Wade* and thus returned the issue of regulating abortions to the states and significantly changed federal policy on access to abortion services.

The federal courts’ functions shape public policy in many ways. The courts serve as gatekeepers by deciding who has “standing to sue” (the legal term for the right to bring suit), who has the right to appeal to the federal courts, or whether a dispute is “ripen,” or ready for review.
The courts also set standards for review, including whether they will defer to the expert judgment of administrative agencies or review an agency’s decisions more critically. Courts interpret the Constitution, statutory language, administrative rules, regulations, executive orders, treaties, and prior court decisions regarded as precedent—using prior court decisions to help make a current decision. The policy language in these various documents may be ambiguous or vague, or new situations may arise that the architects of the language failed to anticipate. The courts have the final say on what any law means unless Congress revises it to make its purpose clearer. Finally, courts also have some discretion in choosing a judicial remedy, such as imposition of fines, probation, or incarceration (O’Leary 2019).

The federal courts, therefore, generally are more constrained in their policymaking roles than Congress and the executive branch. In addition to having to wait for a suitable case, judges must anchor their rulings in law or precedent, not personal beliefs or interest group politics as elected officials are free to do. The legitimacy of the courts depends on the public’s willingness to abide by judicial rulings. If judges deviate too far from acceptable legal rationales for their decisions, they risk losing citizens’ confidence, a concern raised by the Dobbs decision. Still, judges clearly differ in their judicial philosophies, or the bases they use for decision-making. Some are more conservative or liberal than others, and analysts tend to describe the federal courts, especially the Supreme Court, in terms of the justices’ ideological or philosophical leanings.

The president nominates and the Senate confirms federal judges, but their jobs are for life, if they choose to stay in them. For that reason, senators, along with interest groups and the public, scrutinize their views on public policy issues when presidents nominate them. Presidents usually get the judges they want appointed to office, but the Senate sometimes blocks nominees it finds unacceptable, often for ideological reasons. Given the typical lengthy service of a federal judge, a president’s influence on public policy continues for decades after he leaves office. President Obama placed two justices on the Supreme Court—Sonia Sotomayor and Elena Kagan—and in both cases, the confirmations were relatively easy. President Trump nominated and placed three justices on the Supreme Court (Neil Gorsuch, Brett Kavanaugh, and Amy Coney Barrett) and significantly shifted the ideology of the court toward a conservative ideology. As of early 2023, President Joe Biden placed one person on the Supreme Court—Ketanji Brown Jackson—who took the seat of retiring Justice Steven Breyer in 2022, although without shifting the court’s ideological balance. A president’s appointments to the federal courts have had a similar effect on the courts’ shift to the right or left, depending on the ideological vision at the time, an effect that can last for years if the appointed justices are relatively young.17 The box Working with Sources: The Federal Judiciary provides an opportunity to examine what types of Supreme Court decisions, and the justices who made them, have affected public policy.

Under the U.S. system of separated powers, it is essential that the three branches of government cooperate to ensure policy enactment and effective implementation. Indeed, policy results from the interaction of the branches rather than their separate actions. Constitutionally, the legislature may be the branch responsible for policymaking, but many other policy actors must also be involved. It is clear that each branch has a strong capacity to analyze public problems and devise solutions to them, but it is equally clear that building consensus among diverse policy actors with different political incentives and constituencies, although necessary, is rarely easy.
WORKING WITH SOURCES

THE FEDERAL JUDICIARY

As mentioned in the text, federal jurists serve life terms and can leave lasting legacies for the presidents who appointed them. This is especially true at the U.S. Supreme Court, whose decisions and opinions guide the entire federal judiciary. To learn more, go to www.oyez.org and click on the Justices link. You can click on any of the justices to get biographical information, such as how long they served, which president appointed them, and other information. Note the length of time that these justices served on the court. Another way to examine the court’s influence on public policy is to look at a series of cases dealing with a particular public policy issue—for example, abortion or affirmative action in university admission. From the front page of the site, select Cases, then View By: Court Term, and then Issue. Scroll down to Privacy. You will see a few choices, one of which is Abortion and Contraceptives. Some of the cases you may want to examine are Roe v. Wade, Webster v. Reproductive Health Services, Planned Parenthood of Southeastern Pennsylvania v. Casey, and Dobbs v. Jackson Women’s Health Organization.

- How has the court’s position on this issue changed since 1973?
- Note that former Chief Justice William H. Rehnquist participated in the first three of these cases over this twenty-year period. Was he ever in the majority? Did his views change?
- What have been the issues in more recent cases addressing abortion, and how did the court rule? How do these rulings affect abortion rights?

INFORMAL POLICY ACTORS AND POLICY CAPACITY

So far, this chapter has dealt with the formal government institutions involved in making public policy. It is easy for citizens to understand these institutions and the people who work in them. This next section discusses other players in the policymaking process, including the public itself (indirectly and directly) and organized interest groups. In addition, we discuss a theory of how the formal and informal actors work together in the development of policy.

Public Opinion and Policymaking

As one would expect in a democracy, public opinion is a major force in policymaking, even if it constitutes an indirect or passive form of action on the public’s part. Public opinion influences what elected officials try to do, especially on issues that are highly salient, or of great importance to voters, or on those that elicit strong opinions, such as abortion rights or gun control. Although public opinion is rarely the determinative influence on policymaking, it sets boundaries for public policy actions. Policymakers cross those boundaries at their own risk. The broad direction of public policies over time therefore tends to reflect the concerns, fears, and preferences of the U.S. public (Manza, Cook, and Page 2002; Page 1992).

The common definition of public opinion is what the public thinks about a particular issue or set of issues at any point in time (O’Connor and Sabato 2019), but what is meant by “the
public” is not always clear. The attentive public can be distinguished from the general public. The attentive public, typically less than 10 percent of the public, includes those who are apt to take an interest in a particular problem or policy. They are more likely than others to become informed about the issues and to get involved in some way. Actions and communication from either of these groups may influence policy development, but the general public’s opinions tend to shape only the overall direction of policy, while the views of the attentive public, especially of organized interests, tend to have a greater impact. This influence can be especially pronounced for policies with low salience for the general public.

Public opinion is usually expressed as the aggregate or sum of the individual attitudes and opinions of the adult population. Polltakers measure it through interviews, historically conducted over the telephone, with a random sample of the adult population. (In a random sample, each person in the population has an equal chance of being selected.) If following standard opinion research methods, a typical survey or poll of about 1,000 to 1,200 adults will be accurate to within about three percentage points, meaning that the result is only three percentage points higher or lower than it would be if the entire U.S. population had been interviewed. Before accepting a poll’s results as accurate, however, the public policy student needs to ascertain whether the survey followed proper methods. For example, were the questions objective, or did they lead those responding to a particular position? Was a random sample used (Asher 2017)? Internet polls and other self-selected surveys almost always fail to meet these standards, as do many polls commissioned by interest groups, where the use of leading questions is common. The box Steps to Analysis: Public Opinion highlights some sources of public opinion data and shows how one might critically examine the questions and other methods used in surveys. Figure 2.2 illustrates what a well-conducted poll can reveal about the public’s changing views over time—in this case about stricter gun laws from 1990 to 2021. The poll shows how people are responding to whether gun control laws should be more or less strict over this period.

![Figure 2.2: Americans' Desire for Stricter Gun Laws, 1990–2021](https://news.gallup.com/opinion/gallup/393092/americans-recent-attitudes-toward-guns.aspx)

Americans have numerous ways and opportunities to voice their opinions, so policymakers at all levels of government need to be aware of the shifting beliefs of the population. Beyond answering polls or surveys, people can express their opinions through their political participation, which may include not just voting, but attending meetings, writing or speaking to government officials, joining interest groups, and backing referendums and initiatives placed on state or local ballots. These are forms of direct citizen involvement in policymaking, and many states permit their use. In 2016, for example, voters in California approved by a margin of 57–43 percent a statewide ballot referendum that would legalize recreational marijuana for persons 21 years or older. Votes on initiatives and referendums may also reflect public anger or frustration about an issue and not necessarily constitute good public policy.

**STEPS TO ANALYSIS**

**PUBLIC OPINION**

An enormous amount of contemporary poll data can be found on the internet. Several specific examples illustrate the material available and how to evaluate it. If the particular poll data we discuss here are not available when you access the site, try to find comparable information in the newer polls that appear regularly.

The Gallup organization conducts one of the most popular public opinion polls. Go to its website at Gallup.com. Click on the News & Indicators tab and Gallup News. Select one of these issues that is of interest to you (e.g., politics), and review the information and data provided within this topic.

- What conclusions would you draw from these data about public opinion on the issue?
- Is information provided that might allow you to determine how opinion has changed on this issue during the time of the polls? If so, what is this change?

It makes sense intuitively that public opinion should be important in a democracy, even if in a less direct way than a ballot initiative. The truth is, however, that most citizens pay relatively little attention to government, politics, and public policy. They are preoccupied with their families, jobs, health, and other matters that are important to them on a day-to-day basis. As a result, many are not informed on policy issues and have few strong opinions about them. Such opinions are often characterized as being low in both saliency and intensity. Saliency refers to how centrally important an issue is for an individual; intensity refers to the strength of the opinion, or how firmly it is held. Both qualities are important for predicting whether and how likely people are to act on their opinions.

Stability is another dimension of the opinions that people hold. It refers to the continuation of an opinion over time. Public opinion can be fleeting and change quickly, and it can be influenced by current events and the ways issues are presented in the media and by public officials. A good example is what public opinion analysts call the “rally ‘round the flag” effect, which occurs among citizens when an international crisis stirs patriotic feelings and more than usual support for the president and other national leaders. President George W. Bush clearly benefited from the effect following the
9/11 attacks, as did President Obama after the finding and killing of Osama bin Laden; the evidence could be seen in their higher approval ratings. Mass shootings, such as the one in Uvalde, Texas, in May 2022 can often change opinion regarding gun control policy or harden positions of those who strongly support or oppose more stringent gun regulations. As this discussion indicates, it is often difficult to figure out just what citizens want from government and what policy proposals they are prepared to endorse. Yet the more stable public opinion is on an issue, the more likely policymakers are to pay attention and consider the public’s views when making decisions.

Partly because so few Americans approach government and public policy with a clear, strong political ideology, they find it easy to hold inconsistent views on the role of government. Ideologically, a majority of Americans tend to be somewhat conservative—that is, they prefer limited government and, when offered the choice, less bureaucracy and regulation, at least in the abstract. This same majority, however, is likely to demand that government provide a great many services, from regulation of foods and drugs and environmental quality to provision of public education and police protection. The way people react to any given policy proposal depends greatly on how it is presented to them. When pollsters ask people about concrete policy programs, they generally find considerable public support for them. At the same time, politicians can elicit public sympathy if they attack government, bureaucracy, regulation, and taxation in a very general or abstract manner.

Despite the public’s often weak grasp of many policy issues, there are reasons to believe that, given the opportunity, citizens can take a keen interest in public affairs, inform themselves on the issues, voice their opinions, and influence public policies. Especially at the local level, citizens can and do get involved, and they can have a major voice in public policy (Roberts 2015). Even in highly technical areas such as nuclear power and nuclear waste policy, studies suggest a substantial potential for citizen involvement and influence (Dunlap, Kraft, and Rosa 1993; Hill 1992). Moreover, governments have ways to encourage citizens to become more involved if they wish (Ingram and Smith 1993). Local communities that are trying to become more sustainable, for example, have created numerous opportunities for citizens to play a significant role in the process (K. Portney 2013).

**Interest Groups, Nonprofits, and Public Policy**

Organized interest groups are a major influence on public policy, and by most measures their numbers and activities have soared since the 1960s (J. Berry 1997; Cigler, Loomis, and Nownes 2020). The number of citizen groups, or so-called public interest groups, such as the Sierra Club, the National Rifle Association, the Christian Coalition of America, and Mothers Against Drunk Driving, has risen significantly during this period, but so has the number of what are usually termed “special interest groups,” or those with a direct economic stake in public policy, such as organized labor, business groups, and professional associations. A good example is Amazon. In 2000, it spent almost nothing on lobbying, but by 2021, it spent over $20 million, and its activities in Washington, DC, go well beyond traditional lobbying. It works with Washington think tanks, nonprofit organizations, and many others on some issues of obvious importance to its business, such as copyright laws and temporary visas for foreign technical workers, but also on broad concerns related to the future of the internet and new technologies. Most groups are involved in direct lobbying of policymakers, indirect or grassroots lobbying aimed at mobilizing the public or the
group’s supporters, and public education campaigns. Some also engage in electioneering, such as endorsement and support for candidates for office, and in litigation, or challenging government action in the courts. All of these activities reflect the potential power of organized interests, consistent with the description of group theory that we addressed in Chapter 3.

The term “nonprofit” typically refers to organizations that “provide goods or service but are neither private businesses nor government operated” (Vaughn and Arsneault 2021). Many nonprofits can and do operate much like interest groups in that they attempt to influence or advocate for policy that is important to them. There are tax implications that affect the kinds of activities that these organizations can pursue. Many readers may have heard of 501(c)(3) tax-exempt organizations. To maintain this status, nonprofits need to be careful about their involvement in the policy process, but to be clear, they are important players. According to Vaughn and Arsneault (2013), nonprofits and public policy interact in four primary ways: they make policy, they influence policy, they are affected by policy, and they are subject to policy-governing operations.

**Lobbying** is probably the most visible group activity, but it is not what people often suspect—illegal pressure of some kind. Groups lobby legislators mainly by supplying information on their policy views or summaries of policy-related studies they or others have conducted. They may testify in legislative committee hearings, meet with individual members or their staffs, and urge their members and supporters to write or call legislators (Levine 2009). All this activity generally is intended to support policy proposals the group favors, oppose those it does not, or keep certain issues or policy alternatives on or off the legislative agenda. Groups also lobby executive branch agencies by submitting studies and recommendations during formal public comment periods on proposed regulations, as well as through frequent and informal communication with agency officials.

In both the legislative and executive arenas, a great deal of interest group activity consists of trying to block proposals (Kingdon 1995). A good example is the activity of health care and health insurance sectors during deliberations that ultimately led to the passing of the Inflation Reduction Act, which included the ability for Medicare to negotiate drug prices and was strongly opposed by PHARMA, the leading trade association for the pharmaceutical industry. The box Working with Sources: Interest Group Policy Strategies explores the mission, activities, and achievements of two prominent organizations, one usually described as a public interest group and the other as a special interest group.

**WORKING WITH SOURCES**

**INTEREST GROUP POLICY STRATEGIES**

Organized interest groups are pervasive in the policy process. Public interest groups tend to lobby for activities they believe will benefit the entire population. In contrast, special interest groups, particularly economic but also sometimes ideological, support actions that tend to benefit only members of their organization. To examine some of these differences more fully, go to the website of the National Rifle Association (nra.org), and under the Menu tab,
select Politics & Legislation and then NRA-ILA. From here, you can click on the Menu and then Legal & Legislation. Select one of the articles listed and read some of the information on this issue. Now go to any two of the gun control organizations, such as Giffords (giffords.org), and read their perspectives regarding gun control issues. Consider the following:

- Is it clear from the two organizations’ mission statements whom the organizations represent?
- What do the groups state are their primary goals regarding the regulation of guns, the Second Amendment, or related issues? Do they mention recent accomplishments? If so, what are they, and how might such achievements affect their membership?
- What kinds of political tactics do these groups use to promote their ideals? Are there any differences between them?

Many groups issue studies, reports, and news releases. They sometimes produce commercials that air on television and radio or appear in newspapers, on web pages, and on social media intended to educate the public—that is, groups provide information and perspectives on public policy issues and try to win the public to their side. Many interest groups participate actively in the electoral process. They openly endorse candidates for office, contribute money and other resources to their campaigns, and sponsor issue advocacy advertisements to affect voters’ opinions on the issues and, the groups hope, their votes. Groups aim these efforts at getting people who are sympathetic to the particular group’s positions elected or reelected and defeating those who oppose its positions. Groups also use litigation as a policy tool. They may file a suit against an agency because of a ruling or regulation and try to get the courts to change the policy.

The lobbying directed at executive agencies is often intense; after all, the businesses and other groups have a great deal at stake. When administrative agencies implement policy, they write rules and regulations, including specific standards that affect business operations. These rules can have a major impact on business and industry, as well as on ordinary citizens. The federal Administrative Procedure Act of 1946 (APA) requires that the rulemaking process follow due process of law and be open and fair. Because of the importance of these administrative decisions, interest groups often discuss the issues informally with agency officials (Kerwin and Furlong 2019; Kraft and Kamieniecki 2007). For example, during 2015 and 2016, many industry representatives (and others) were keenly interested in a new Department of Labor regulation that extended overtime eligibility to millions of additional people. The proposed rule generated comments from 270,000 individuals and organizations.

Business, labor, and other interests act more formally through the rulemaking process as well, particularly when a proposed rule or regulation is open to public comment. The APA requires that agencies considering the issuance of regulations propose them and allow for public comments before adopting and implementing them. The content of these comments varies widely, ranging from opinions on the rule’s importance to extensive analysis of the rule’s likely consequences, technical merits, costs, and benefits. Although anyone may provide comments to administrative agencies under these circumstances, the vast majority of comments come from interest groups directly affected by the agency’s policy. Therefore, if the FAA proposes a rule to require that all children under the age of two be seated in a child safety seat on airplanes, one expects the airlines, and perhaps groups representing consumers, to provide most of the public comments.
The role of interest groups in the U.S. system of government is important for understanding the policymaking process. It also raises questions that are fundamental to a democracy. For example, are ordinary citizens well represented in the activities of interest groups, or do certain groups and segments of the population, such as corporate interests and wealthy citizens, have privileged access at the expense of others? To what extent should the activities of interest groups be restricted in some way to promote policy developments that serve the public interest? There is little question that interest groups are omnipresent and highly influential in the policy process at all levels of government and within all branches. Yet analysts disagree on whether such restrictions would promote the public’s interest or are consistent with constitutional guarantees of assembly and free speech (J. Berry 1997; Cigler, Loomis, and Nownes 2019).

Media

The First Amendment to the Constitution states that “Congress shall make no law . . . abridging the freedom of speech, or of the press,” among other elements. This issue has been particularly relevant in recent years as former President Donald Trump has suggested that attempts to limit such freedoms are appropriate, evident in his characterization of the press as biased against his administration and thus, as he saw it, “the enemy of the people.” In the United States, we value
not only our freedom of speech but also the assurance that freedom of the press is protected. Democratic theorists would argue both are necessary for a well-functioning democracy. The media today play an interesting and evolving role in the policy process. At the most basic level, the media report information that helps to inform the citizenry about the politics of the day and the policies debated and passed. This information helps shape public opinion regarding these policies. The media also can influence the policy agenda by the way they cover news stories and politics, perhaps noticing a story and bringing it to the public's attention in such a way that raises its importance and sparks activity on the issue.

A full history of the evolution of the news media and their role in public policymaking is beyond the purposes of this section. It is important to realize, though, the notable change in the amount of media coverage, how we as citizens access this information, and the different media forums that transmit this information to us. For most of our history, news coverage occurred at set times of the day—the morning paper and the nightly news broadcast, which to some extent still exist today. But the media now constitute a twenty-four-hour, seven-day-a-week business with each media network trying to outscou the other. Many citizens now receive their news from the web on their own time rather than waiting for the nightly newscast—and increasingly from social media sites, such as Facebook and Twitter, rather than traditional new sources. The growth in the forms of media has also created outlets that tend to tailor their broadcasts to certain ideological audiences. For example, Fox News appeals to conservative viewers and MSNBC to liberals (Jamieson and Cappella 2008).

The changing nature of how we get our news highlights the importance of critically evaluating information and the sources from which it comes. Many organizations and businesses are funding their own “media” outlets to get certain kinds of information out as a way to sway public opinion. On the right, the Koch brothers have been one of the more active in this regard, and on the left, George Soros does the same. Of course, relying on just the one traditional source of news, as many did when they would watch Walter Cronkite present the evening news on CBS in the 1960s and 1970s, also can be problematic, as it might result in filtering or distortion of some news and a lack of informational depth. National newscasts only last about twenty-two minutes, and as a result, each story covered typically receives only a couple of minutes of coverage before the news anchors move on to the next story. For a different perspective and more in-depth coverage, readers may want to try the *New York Times* podcast *The Daily*, which spends entire episodes on a single news item.

One issue that came to the forefront during the 2016 election and continued throughout the Trump administration and beyond is the role of what many call “fake news.” Stories from these sources often will “report” on some damaging characteristic or perspective on a recent event. The reporter or news source may anticipate that the story will generate enough “buzz” and discussion that many people will believe it to be true. Even when more legitimate sources discredit such stories, many people still believe the original inaccurate or “fake” story. When social media sites like Facebook and Twitter pick up these stories, they may reach a wide audience, including many who believe in the account because it appears to be from a legitimate source. This is why it is so important to know your sources and have a good understanding about the facts as you are evaluating policies and policymakers. Of course, the Trump
administration used the term “fake news” to label many stories coming out of traditionally respected news sources such as the New York Times and the Washington Post, among others. Critics of the administration said that it labeled stories it did not like as “fake” in the hope that they would have a lesser impact.

Policy Subgovernments and Issue Networks

Much policymaking occurs in less formal settings or venues and involves policy actors within particular issue areas, such as national defense, communications, agriculture, forestry, or energy. Political scientists refer to these informal arrangements as subgovernments or issue networks (Heclo 1978; Lowi 1979; McConnell 1966; McCool 1990). “Iron triangles” was another term often used to describe these arrangements because of the supposed power and autonomy of their three components: congressional subcommittees, an executive agency, and an outside economic interest group, such as cotton farmers or oil companies. These subgovernments usually operate under the radar of most citizens and are less likely than the more formal institutions to be influenced by citizen values or policy preferences.

The reality is that decision-making about many programs and policies tends to be highly specialized. Because of the complexity of public problems and policies, and the often detailed
knowledge required to understand them, specialization will no doubt continue to be the norm. One group of policy actors specializes in health care policy; another quite different group acts in defense policy, financial regulation, or environmental protection. Each develops its own distinctive channels of communication, even terminology, to discuss policy issues. The areas of specialization, and the people and institutions active in them, are known as issue networks, subgovernments, or subsystems to reflect the fact that decision-making takes place below the level of the full system of government (J. Anderson 2023; J. Freeman 1965; Thurber 1996a). For example, defense procurement decision-making (how much to spend on weapons systems and which ones to buy) involves the congressional armed services committees, the Department of Defense, and the private defense contractors who build the weapons. All tend to favor increased spending for defense, and they work together toward provision of defense systems, usually without much involvement, oversight, or criticism by those who are not part of the subgovernment or network.

Historically, the subgovernments have been exceptionally powerful in setting U.S. policy, particularly in areas of limited interest to the general public, such as agricultural subsidies, mining and forestry, weapons procurement, and highway and dam construction. Today, however, the subgovernments are less autonomous and operate with more visibility and “outside” participation. More policy actors are involved, sometimes hundreds of different institutions and individuals. Use of the term “issue network” rather than “subgovernment” reflects this evolution in U.S. policymaking (Heclo 1978). Nevertheless, these networks or subsystems are still important. To varying degrees, their participants remain preoccupied with narrow economic interests; they may afford limited participation beyond the core members; and they may be able to resist external influences (J. Anderson 2023). If nothing else, it is clear that much U.S. policymaking involves informal networks of communication in which prevailing policy ideas and the evaluation of new studies and information shape what is likely to be acceptable to the major policy actors (Kingdon 1995). Fortunately for students of public policy, it is much easier today to gain access to those networks and to see what the specialized policy communities are considering and where change may be possible.

**IMPROVING POLICY CAPACITY**

This chapter demonstrates that the design of U.S. government institutions and the conflicting demands of the nation’s citizens make governing a difficult, though by no means impossible, task. The history of U.S. public policy development in many areas, as we will show in Chapters 7 through 13, indicates a robust capacity for policy formulation, adoption, and implementation. The proof is in the extensive collection of public policies in operation today. One can say the same about the policy capacity of state and local governments. Although some are clearly more capable than others, considerable policy innovation and successful implementation are apparent at this level as well (Borins 1998; Hedge 1998).

Does policy capacity need to be improved? Almost certainly. By any measure, the challenges that governments at all levels will face in the future will require an even greater ability than they now possess to analyze complex problems and develop solutions. Whether the problems
are worldwide terrorism, economic recessions, natural hazards such as hurricanes, or global climate change—or whether they are public needs for education, health care, and other social services—governments will have to do a better job of responding to these needs.

Consider one example. When a devastating hurricane struck New Orleans and other Gulf Coast areas in September 2005, critics described the responses by federal, state, and local governments as woefully inadequate. Hurricane Katrina killed over 1,000 people and left a far larger number injured or homeless, many of them residents of poor and minority communities. The storm also destroyed countless businesses. Government agencies had to drain severely flooded neighborhoods, restore public services over a wide area, assist hundreds of thousands of residents displaced by the storm, and rebuild damaged levees and other structures across a wide stretch of the Gulf Coast. It was perhaps the worst natural disaster in U.S. history in terms of economic impact, costing between $100 billion and $150 billion, according to the Congressional Budget Office (CBO). While governments cannot prevent hurricanes, they can do much to improve their capacities for emergency preparedness and disaster relief. One lesson from Katrina is that governments might have avoided the enormous human and economic toll had they made smarter decisions over the previous decade. The response to Hurricane Sandy in 2012 and Irma in 2022 suggests that at least some lessons were learned, and the governmental response was much better. But as we saw with Hurricane Maria’s impact on Puerto Rico in 2018, there is still much we need to improve.

What about the capacity of citizens to participate in public life? Here, too, there is much that can be done, and we will return to the subject in Chapter 13. In brief, it is easy to argue that in a democracy, government should give citizens extensive opportunities to participate in policymaking. Yet some analysts worry that citizens have too little time and too little interest to inform themselves on the issues so that they can participate effectively. Others focus on what measures might be taken to assist citizens in learning more about the issues and encourage their participation. From either perspective, questions arise. For example, is it a good idea to create more state and local referendums to allow direct citizen participation in lawmaking? Many cities and states do that, and as we stated earlier, citizen participation has led to the enactment of some highly innovative policies. But there is also a risk that such direct democracy can fuel public prejudice and allow special interest groups to have undue influence on the results (Cronin 1989; Ellis 2002).

What is the best way to encourage citizen participation in government processes? It seems clear that additional citizen participation may enhance policy capacity at the state and local levels, but some programs designed to involve citizens are more effective than others. Most scholars today recognize the desirability of going beyond the conventional hearings and public meetings to offer more direct and meaningful citizen access to policymaking. Citizen advisory committees, citizen panels, and similar mechanisms foster more intense citizen engagement with the issues (Beierle and Cayford 2002). Governments at all levels continue to endorse collaborative decision-making with local and regional stakeholders, especially on issues of urban planning and management, natural resource use, and the like.

Whatever the form of public involvement, its effectiveness needs to be considered. Increasing citizens’ voices in policymaking can come at some cost in terms of the expediency
of policy development and implementation. In other words, it can slow down the policy process and make it more difficult to resolve conflicts. Even with these qualifications, however, the successful involvement of the public in local and regional problem-solving processes and in electoral processes is encouraging for the future. Enhancing civic engagement in these ways might even help to reverse a long pattern of citizen withdrawal, not only from politics but also from communities (Bok 2001; Putnam 2000; Skocpol and Fiorina 1999). The enormous outpouring of support for Barack Obama in the 2008 presidential election, particularly by young voters, testifies to the potential of greater citizen involvement in the future and also to the diversity of mechanisms for such involvement, from traditional organizational politics to web-based recruitment, fund-raising, and communication (Dalton 2009; McKenna and Han 2014).

CONCLUSIONS

This chapter covers a lot of ground, from the growth of government over time to the constitutional design for U.S. government to the way policy actors within the major institutions interact when dealing with public problems and policymaking. Government growth is a direct result of the increases in public policies adopted in the United States throughout history. To fully understand the development of policy, we must pay attention to the various actors in our formal government systems and how they all have a role in making or obstructing policy. In addition, how people interact in this political and governmental process is a key factor in explaining if policy gets made at all and the policy choice that follows. In a democratic system of government, these actors outside the formal government structure, such as interest groups, the media, and citizens themselves, also influence the policy process. Understanding how these actors get involved in the policy process is important in explaining how and why policy gets made. It is also through both the formal and informal actors that individuals can get involved and help to move policy in a particular direction.

All of these factors help to explain why governing is so difficult and why policy gridlock occurs so often. But the same factors also highlight the many strengths of the U.S. political system, particularly the opportunities it provides for citizens and organized groups to participate in the policy process and shape the decisions that are made. These strengths are found at all levels of government, but especially in the states’ growing policy capacity and their efforts at policy innovation in recent years. Knowing how government is organized and makes decisions is the foundation for the study of public policy, but equally important is understanding the political incentives that motivate and influence how policy actors, both governmental and nongovernmental, relate to one another in the policy process. Armed with these tools, students of public policy can see why government sometimes works and sometimes does not and what needs to be done to improve government’s capacity for analyzing public problems and developing solutions to them. In the same vein, the chapter suggests that few changes would do more to enhance democracy than finding ways for U.S. citizens to become better informed about public policy and more engaged with government and the policy process.
DISCUSSION QUESTIONS

1. Do you think the U.S. government’s system of checks and balances is a detriment to policymaking? Why or why not? Do the current partisan battles suggest that we may need to adjust our policymaking system? What might be done?

2. Under what conditions might states be better positioned to take the lead in making policy? Conversely, when should the federal government take the lead? Think about some current issues such as education standards, immigration, abortion, and gun control policy. Which level of government may be best positioned to address these issues?

3. Has the Biden administration been effective so far in policy development? Discuss some of the major successes and failures and what factors contributed to the successes or failures.

4. Is the American public capable of playing a more active role in the policymaking process than it currently does? Or would greater public involvement in policymaking pose risks to the quality of decision-making? Why do you think so?

5. What role does interest group information play in policymaking? What do you see as the potential positives and negatives of having groups provide this information to policymakers? What might policymakers want to take into account when receiving information and data from interest groups?

6. Excessive partisanship, gerrymandered congressional districts, policymakers beholden to special interests, and government stalemate tend to dominate the Washington, DC, news. Might there be ways to reboot the system so that it could work more effectively, efficiently, or ethically?
