

# 1 STUDYING HEALTH POLICY

## CHAPTER CONTENTS

- Introduction
- What is a 'policy'?
- Defining the characteristics of a public policy
- Scoping the field of health policy analysis
- Conceptual frameworks in policy analysis
- 'Power' as a key concept for critical policy analysis

### <sup>1</sup> INTRODUCTION

---

<sup>2</sup> Where there was once a broad agreement about the main constituents of  
<sup>3</sup> the study of health policy, many of these assumptions are today subject to  
<sup>4</sup> dispute. In introducing the reader to the field of health policy studies, this  
<sup>5</sup> chapter examines the divergent theoretical frameworks that are drawn upon  
<sup>6</sup> in the contemporary analyses of policy and in particular, the differences in  
<sup>7</sup> the way in which political power is conceptualised.

### <sup>8</sup> WHAT IS A 'POLICY'?

---

<sup>9</sup> Policy as a concept is neither a specific, nor indeed a concrete phenomenon,  
<sup>10</sup> so to attempt to define it poses a number of problems. It is more fruitful to  
<sup>11</sup> see policy as a course of action or '*web of decisions*' or decision network,  
<sup>12</sup> rather than a single identifiable decision (Hill, 1997: 7). Policies are on-going  
<sup>13</sup> and dynamic and therefore are subject to change, particularly in response to  
<sup>14</sup> problems arising out of implementation of a decision. Policy can also be just  
<sup>15</sup> as much about inaction ('non-decision-making') as action; the maintenance  
<sup>16</sup> of the status quo. Policy can also be an outcome of actions taken over a  
<sup>17</sup> period of time, by 'low-level actors' within an organisation, which have  
<sup>18</sup> not been formally sanctioned by a decision taken by those at the 'top level'.  
<sup>19</sup> Here, policy can be seen as emerging as an outcome of process rather than as  
<sup>20</sup> a formal decision to follow a course of action. It should also be noted that in

1 the French language no distinction is made between the words ‘policy’ and  
 2 ‘politics’. In this sense, a formal model of policy-making would be rejected  
 3 in favour of an understanding of ‘policy’ as political in the widest sense of  
 4 the word.

## 5 DEFINING THE CHARACTERISTICS OF 6 PUBLIC POLICY

7 Is there then anything distinctive about public policy as against those  
 8 policies adopted by corporate organisations or even those of individuals? In  
 9 terms of simple characteristics, the answer is ‘no’. However, because public  
 10 or state policy emanates from the government as the legal authority within  
 11 a society nation, it follows that it has a primacy and influence over all other  
 12 policies (private and personal). These public policies provide the legalistic  
 13 framework through which individuals must operate. A private company for  
 14 example cannot decide that it wants to employ women at a lower rate of  
 15 pay for performing a job than male employees doing the same job. This is  
 16 because it would be in breach of the Equal Opportunities legislation and  
 17 therefore subject to legal sanctions.

18 One possible starting point in attempting to define public policy and  
 19 policy-making is to examine how the UK government itself has presented  
 20 these issues. Relatively early on in its first term in office, the New Labour  
 21 government published a White Paper entitled *Modernising Government*  
 22 (Cabinet Office, 1999), which sets out the ‘official’ view of policy-making  
 23 as follows: ‘Policy making is the process by which governments translate  
 24 their political vision into programmes and actions to deliver “outcomes” –  
 25 desired changes in the real world’ (Cabinet Office, 1999: para 2.1). The  
 26 White Paper goes on to outline the six key characteristics associated with  
 27 what it termed a ‘modernising’ (health, social, economic, etc.) policy; these  
 28 characteristics are set out below:

- 29 • *Strategic* – A modernising policy looks ahead and contributes to long-  
 30 term government goals.
- 31 • *Outcome focused* – A modernising policy to aims deliver desired changes  
 32 in the real world.
- 33 • *Joined up* – A modernising policy operates across the organisational  
 34 boundaries of government.
- 35 • *Inclusive* – A modernising policy is fair and takes account of the interests  
 36 of all.
- 37 • *Flexible and Innovative* – A modernising policy tackles cause, not  
 38 symptoms, and is not afraid of experimentation.

- 1 • *Robust* – A modernising policy stands the test of time and works in  
2 practice from the start.

3 This definition will be returned to again later within the book as one possible  
4 outcome measure of health policy, utilising the government's own terms of  
5 reference.

## 6 SCOPING THE FIELD OF HEALTH 7 POLICY ANALYSIS

---

8 The academic study of health policy in the UK has traditionally been  
9 focused upon the formal institutions of the welfare state charged with  
10 the treatment and care of the sick. The primary concern of these studies  
11 has been the analysis of the organisations and structure of the NHS, as  
12 well as the rather more poorly defined area of public health. From the late  
13 1950s onwards, health and social policy studies as an academic discipline  
14 established a conceptual base, drawing almost exclusively upon its own  
15 internal theoretical and analytical frameworks, rooted in a set of implicit  
16 political and philosophical assumptions associated with the emergence and  
17 development of the post-war welfare state. This *de facto* delineation of  
18 the academic study of health policy effectively played down the potential  
19 contribution of the disciplines of sociology, politics and economics to policy  
20 analysis. However, the last two decades this rather narrow approach to the  
21 subject has come under sustained criticism, largely as a consequence of  
22 real world political developments. The health and social policies of the  
23 Conservative governments of the late 1980s and early 1990s, and to a  
24 debatable extent the New Labour governments since 1997, have sustained  
25 the neo-liberal challenge to the very idea of universal state provision of  
26 social welfare and health services. Thus, the very basis of an academic  
27 discipline centred on the welfare state was itself disrupted. It was now  
28 no longer appropriate or relevant to study social and health policy in  
29 isolation from other forms of social organisation and social structures  
30 (Coffey, 2004: 3).

31 The work of many of the early pioneers of health and social policy  
32 analysis in Britain, such as that of Richard Titmuss (1958; 1970), Peter  
33 Townsend (1970a), and Brian Abel-Smith (Abel-Smith and Townsend,  
34 1966), was informed by a detailed sociological analysis of the workings of  
35 the welfare state and its impact of the health and social welfare services  
36 on the lives of ordinary people. These studies revealed that the health  
37 and welfare needs of many of the most deprived groups in post-war  
38 Britain were not being met because the state left the forces of the market  
39 economy largely unchecked. These structures of exploitation were seen

1 to reproduce poverty across the generations and to sustain poor levels  
2 of health. The criticisms levelled at the academic discipline of health and  
3 social policy analysis in the 1980s and 1990s were that it chose to focus  
4 on organisational matters whilst all too often it neglected to assess whether  
5 the founding social and political goals of the welfare state (including the  
6 NHS) were still relevant to the health and social needs of the population –  
7 for example, whether the worst effects of poverty and low income were  
8 being addressed, or whether access to good quality healthcare was available  
9 to all irrespective of social status and income. These were the original  
10 concerns that inspired the work of Titmuss, Townsend and Abel-Smith,  
11 who, whilst supportive of the goals of the welfare state, always engaged  
12 in a critical analysis of the practice of the NHS and other state welfare  
13 institutions.

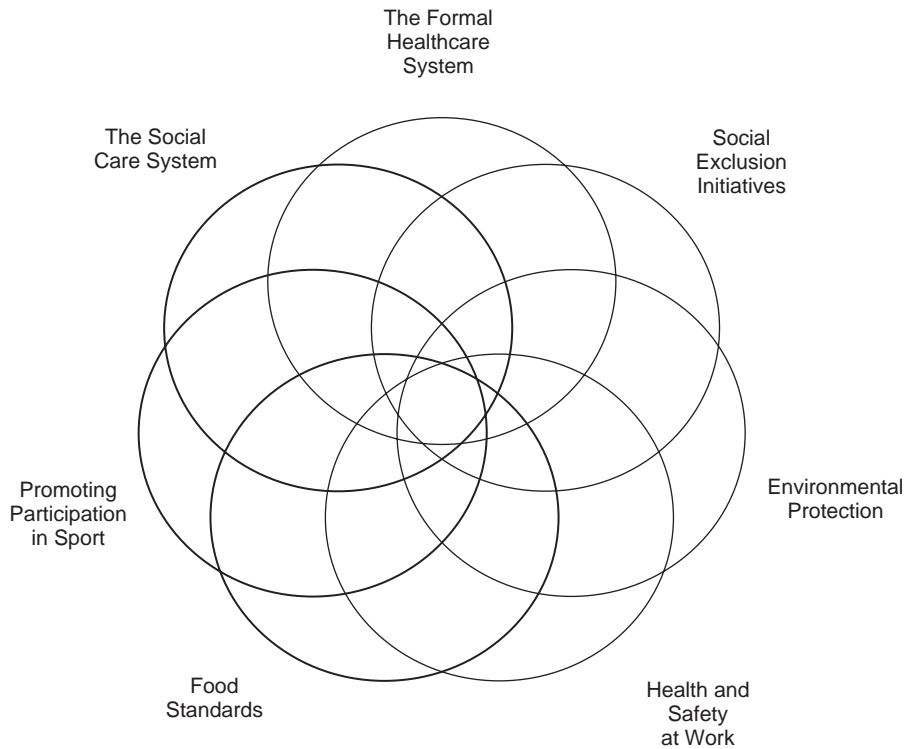

14 As will be apparent from the discussion in the introductory chapter,  
15 the aim of this book is to engage in a process of critical analysis of  
16 contemporary health policy. The first stage in this process, given the  
17 previous discussion concerning the limitations of traditional analytical  
18 approaches, is to delineate in its widest sense the potential field of  
19 health policy analysis. This means moving beyond the confines of an  
20 analysis of the formal institutions of healthcare, and assessing all those  
21 policies (both public and private) that impact upon health and well-  
22 being of the population, employing the conceptual tools of both soci-  
23 ology and political science; this scope of policy analysis is set out in  
24 Figure 1.1.

#### 25 THE FORMAL HEALTHCARE SYSTEM

26 This was gradually constructed over the course of a century-and-a-half in  
27 order to better manage the clinical needs of those in the population who  
28 were sick and disabled, and this largely remains its focus to this day. The  
29 healthcare system in Britain has historically never given priority to disease  
30 prevention and health promotion. Apart from policies directly affecting the  
31 formal healthcare system itself, also included in Figure 1.1 are the following  
32 areas with potential impacts on the health outcomes of the population, and  
33 which therefore should be a concern of health policy analysis.

#### 34 ENVIRONMENTAL PROTECTION

35 This covers areas such as atmospheric pollution, the use of toxic chemicals  
36 and radiation, the effects of global warming, the promotion of more efficient  
37 use of non-renewable resources, the planting of genetically modified (GM)  
38 crops, and many other developments with the potential to compromise the  
39 natural environment and therefore negatively affect the long-term health of  
40 the population.

**Figure 1.1 Scoping the field of health policy analysis**

- 1 **FOOD STANDARDS**
- 2 This is the area of state regulation and enforcement of legislation which
- 3 serves to protect the public’s health and consumer interests in relation to
- 4 food. This covers issues of food hygiene, nutritional standards, and food
- 5 labelling.
  
- 6 **HEALTH AND SAFETY AT WORK**
- 7 The Health and Safety Commission (HSC) and the Health and Safety
- 8 Executive (HSE) are responsible for the enforcement of legislation and the
- 9 regulation of almost all the risks to health and safety arising from work
- 10 activity in Britain, as well as many other aspects of the protection both of
- 11 workers and the public.
  
- 12 **SOCIAL CARE SYSTEM**
- 13 This covers the health and social area of care provided outside the formal
- 14 healthcare system for those living with chronic illness and disability,
- 15 learning and physical disabilities, as well as those and long-term mental
- 16 health problems.

## 1 SOCIAL EXCLUSION INITIATIVES

2 This covers those government intervention programmes that have been  
3 increased over the past decade in order to remove families from living in  
4 poverty with all its negative impact on long-term health. These initiative  
5 include the *Sure Start* programme designed to improve the health and  
6 emotional development for young children living in deprived communities  
7 by increasing the availability of childcare for all children and supporting  
8 parents in their aspirations towards employment. Britain has the highest  
9 rate of teenage pregnancy of any Western European country. This ‘social  
10 problem’ is seen to reflect low expectations as well as economic deprivation,  
11 and as such is recognised as having long-term health and social implications  
12 for both the young mothers and their children; a nationally coordinated  
13 action plan now exists to reduce this high rate.

## 14 PROMOTING PARTICIPATION IN SPORT

15 It has become a truism that the popularity of sport in Britain is restricted  
16 to watching it rather than active participation. In England, *Sport England*  
17 (formerly the English Sports Council) is the body responsible for distributing  
18 funds and providing strategic guidance for promoting sporting activity in  
19 England. Its slogan is ‘Get active, healthy and happy’, which emphasises the  
20 importance of sport participation for the health of a largely sedentary pop-  
21 ulation. The funding for this organisation comes from central government  
22 and the National Lottery, and since 1994, it has invested over £2bn of  
23 Lottery funds and £300 million from the Treasury into supporting not only  
24 professional sport but in promoting greater community participation in  
25 sport in England. However, with the awarding of the 2012 Olympic games  
26 to London, the debate about whether disproportionate amounts of public  
27 money is spent on elite rather than grassroots sport has widened.

28 All those areas where policy impacts upon health outcome will be  
29 explored in the book, although the substantive content of the book will  
30 focus upon the formal healthcare system. However, the analysis will not be  
31 restricted to an examination of White Papers, strategy documents and the  
32 top-down interventions by the Department of Health. A significant concern  
33 of this textbook is how these centrally devised policies are interpreted and  
34 implemented in practice.

35 CONCEPTUAL FRAMEWORKS IN THE  
36 ANALYSIS OF HEALTH POLICY

37 Whilst delineating the field of health policy analysis is one stage of the  
38 analytical process, the next stage is to critically examine the range of  
39 conceptual frameworks that are used to assess health policy.

1 All academic and indeed all so-called common-sense understanding,  
2 whether practical or theoretical, involves the use of some sort of model or  
3 conceptual schema in order to simplify and make sense of the tremendous  
4 variety of potential variables that exist in the social and physical world. In  
5 the complex process of health policy formation and implementation within  
6 a dynamic political and economic system such as exists within the UK,  
7 the application of conceptual frameworks that are drawn from a range  
8 of theoretical perspectives is essential if we are to gain an understanding  
9 of the hows and whys of current health policy. To demonstrate the  
10 importance of this point, the analysis of the institutions and organisational  
11 processes associated with the modern welfare state has traditionally been  
12 heavily reliant upon models which derive from a theorisation of the  
13 historical role of the State, as the vehicle for the social and national  
14 transformation and development. However, this is just one theorisation  
15 of the role of the state within modern capitalist societies, there are  
16 many other competing explanations of the role of the state that can  
17 be found within sociological analysis; these are discussed in detail in  
18 Chapter 2.

19 As discussed in the Introduction, the aim of this textbook is to contex-  
20 tualise the essentially political process of formulating and implementing  
21 health policy by locating specific developments within a broader set of  
22 social and institutional processes. This involves synthesising theoretical  
23 constructs relevant to the analysis with an empirical description of the  
24 specific processes associated with the development of a particular policy.  
25 This is what is meant by integrating theory with practice. Hence, while  
26 the opening chapters of the book give broad descriptions of the range of  
27 theoretical frameworks of analysis utilised with policy analysis this should  
28 not be seen as a process of ‘front-loading’. Where they are most relevant to  
29 the discussion of specific health policy developments, ‘key concepts’ deriving  
30 from a wide range of theoretical traditions within sociology and political  
31 theory will be introduced to facilitate analysis. This approach is designed  
32 to avoid a tendency which is sometimes found in policy analysis, which  
33 acknowledges the importance of theory whilst failing to explicitly integrate  
34 it in practice.

35 At a general analytical level, health policy can be conceptualised in terms  
36 of macro and micro social processes. At a macro level this involves the  
37 assessment of the workings of social and institutional structures such as  
38 the State, the market, economic and legal frameworks, as well as formal  
39 institutions of social welfare such as the NHS. At a micro level of analysis,  
40 the focus is on the impact of policy at the level of the practice of healthcare  
41 professionals as well as upon the experiences of the users of the service as  
42 they negotiate their way through the often labyrinthine pathways of the  
state healthcare system.

## 1 'POWER' AS A KEY CONCEPT FOR 2 CRITICAL HEALTH POLICY ANALYSIS

3 This first chapter concludes with an outline of 'power', an essential  
4 conceptual tool in any critical analysis of the formation and implementation  
5 of health policy. Following this outline you are invited to participate in an  
6 exercise which assesses your understanding of power by exploring the idea  
7 that a health policy need not necessarily be about innovation and change  
8 but can also be about maintaining the status quo.

9 The notion of 'power' is very much a contested construct, and its use in  
10 policy analysis is therefore highly value-dependent. Conceptualisations of  
11 power reflect particular moral and political positions, and usually rest on  
12 normatively specific conception of interests (Lukes, 1974). So for example,  
13 the Cabinet Office (1999) definition of policy sees it as the ability, '...to  
14 deliver outcomes – desired changes in the real world'. This definition  
15 carries with it an implicit conceptualisation of power as something deriving  
16 from the democratic mandate of an elected government charged with  
17 instigating a programme of policy reform. The classic presentation of  
18 power within social theory is that it represents, '...the chance of a man  
19 or a number of men to realize their own will in a communal action  
20 even against the resistance of others who are participating in the action'  
21 (Weber, 1978: 926).

22 This definition raises the question of whether in the absence of any  
23 observable conflict, power is actually being exercised. This issue was  
24 explored in Dahl's influential work in which he argued that power resides  
25 in the *potential* a person has to influence and direct the behaviour of  
26 others; reflected in the much quoted position that; 'A has power over  
27 B to the extent that he can get B to do something that B would not  
28 otherwise do' (Dahl, 1957). This is a conceptualisation of power as a  
29 form of domination, manifested in successful acts of decision-making.  
30 However, this view of power has been criticised as being overly narrow  
31 and conceived primarily in relational terms. Lukes (2004) has argued that  
32 whilst the empirical observation of the exercise of power in decision-making  
33 can provide evidence of its possession, and that the counting of 'power  
34 resources' such wealth, status and influence can provide evidence of how  
35 power is distributed within a given society, power is primarily, '...a *capacity*  
36 and not the exercise or the vehicle of that capacity' (2004: 70). Power is  
37 seen as a potentiality rather than an actuality, in that it does not need to be  
38 seen to be exercised to exist.

39 In his seminal work written in the 1970s, Lukes (1974; 2004) identified  
40 three 'dimensions' of power. What Lukes termed the 'one-dimensional  
41 view' is the Weberian conceptualisation that is described above. It is

1 a one-dimensional because it is seen to focus exclusively on observable  
2 behaviour (reflecting Weber's primary concern with social action rather  
3 than structures) in the making of conscious decisions around an identified  
4 controversial issue. While this view of power offers a relatively straightfor-  
5 ward pathway for policy studies because of its focus on the decision-making  
6 of key political agents, for Lukes it is essentially blind to the ways in  
7 which the policy agenda is controlled (1974: 58). The 'two-dimensional  
8 view' is one in which power is conceived of as involving both decision-  
9 making and non-decision-making. Where a decision is defined as a choice  
10 among alternative 'modes of action', and a non-decision is one that results  
11 in 'suppression or thwarting' of either a 'latent or manifest challenge' to the  
12 interests of the decision-maker (1974: 44). Those with power exercise it to  
13 prevent particular issues being placed on the policy agenda or to prevent  
14 decisions being taken. Thus in policy analysis it becomes important to  
15 examine not just issues about which observable political decisions are made,  
16 but also to identify potential issues which non-decision-making prevents  
17 from being actual issues for political debate.

18 Lukes's (1974) critique of this two-dimensional view is that while it  
19 attempts to move beyond an exclusive focus on actual decision-making  
20 behaviour, it nevertheless continues to place too much emphasis on the  
21 actions of individuals within that system. Lukes argues that attention should  
22 also be given to the ways in which these actions arise from the socially  
23 structured and culturally patterned behaviour of groups of decision-makers  
24 (1974: 22). Both the one- and the two-dimensional views presuppose that  
25 power is only exercised in situations of actual conflict between different  
26 interest groups, but this position often fails to acknowledge that, '...the  
27 most effective and insidious use of power is to prevent such conflict from  
28 arising in the first place' (1974: 23). Lukes goes on to argue that it is a  
29 mistake to assume that non-decision-making power, '...only exists where  
30 there are grievances which are denied entry into the political process in the  
31 form of issues' (1974: 24). This ignores the possibility that the interests  
32 of social groups have not already been shaped so that they '...accept their  
33 role in the existing order of things, either because they can see or imagine  
34 no alternative to it, or because they see it as natural and unchangeable'  
35 (1974: 24).

36 Lukes argues that it is therefore necessary to think in terms of a  
37 third dimension in which the exercise of power is constituted in the  
38 ability to manipulate and shape the wants, needs, values and norms of  
39 behaviour of a population. This is achieved through the hegemony (or  
40 leadership) of a dominant group in a society, exercising power through  
41 ideological structures such as the education system, the media, and various  
42 other socialisation processes. Thus in the political policy-making pro-  
43 cess there is both observable conflict (the first and second dimensions)

1 and latent conflict arising out of the contradictions between the inter-  
2 ests of those exercising power and the ‘real interests’ of those they  
3 exclude (1974: 25).

4 An alternative and highly influential reading of power is present in the  
5 work of Michel Foucault (1979a; 1980) who sought to ‘re-conceptualise’  
6 power by seeing it not as a property of individual or collective social agents,  
7 but as ‘a machine that no one owns’. That is, as society has transformed  
8 itself into its modern form so power became ‘knowledge’, in that objects and  
9 events are interpreted or constitute using knowledge not only in theoretical  
10 terms but in daily practices. A unity of thought in a particular society at  
11 a particular time, constitutes what is seen to be rational or ‘the truth of a  
12 situation’, and therefore valid and worthy of discussion. This form of power  
13 has the effect of excluding other explanations.

#### 14 ACTIVITY

15 (a) Identify an issue which you perceive as negatively affecting your own health  
16 and that of your family in some way. The issue can be as broad or as narrow  
17 as you like. For example it could be that you would like your child’s school to  
18 provide healthy options rather than processed food for school lunch; you want  
19 the government to take more proactive steps to reduce environmental pollution;  
20 your employers refuse to take steps to reduce the amount of stress that you  
21 experience at work; etc.

22 (b) Then identify with reasons for your decision which of the theorisations of  
23 the nature of power described above (Weber’s decision-making process model,  
24 Lukes’ third dimension, or Foucault’s discursive practices) that you think best  
25 explains the failure to act upon the problematic health issue that you have  
26 identified?

#### 14 ACTIVITY 1 – COMMENTARY

15 Whatever health issue you have identified, it is likely to be one that you  
16 regard as being beyond your individual ability to change. This may have  
17 led you on to the question of who or what (a political figure, a local  
18 institution or central government) has the power to bring about such  
19 change. Questions may have also arisen such as: Who do I approach in  
20 order to present my grievance?; Is there a formal public accountability  
21 system in place to allow me to present the issues? Or whether you perceive  
22 the system to be intractable and unresponsive to your needs? If the latter is  
23 the case, do you think that some form of extra-institutional pressure can be  
24 brought to bear on the key decision-makers through some form of collective

1 action through the means of tenants associations, trade unions, or parents/  
2 patients groups?

### 3 SUMMARY

4 This chapter has introduced students to the field of health policy and  
5 raised the issue of the importance of appreciating the importance of  
6 the conceptual framework that is employed in the analysis of the policy  
7 process. In that it is the political, moral and philosophical assumptions  
8 underpinning this framework that will shape the form of the analysis.  
9 The contested nature of power as a key conceptualisation employed  
10 in health and social policy analysis was highlighted as a preliminary  
11 to the detailed assessment of the construction of health policy in later  
12 chapters.
